## **APPENDICES**

Appendix A – Completed SWRP Checklist and Self-Certification Form

Appendix B – Summary of Conceptual Projects

Appendix C – Stakeholder Involvement

Appendix D – Summary of Relevant Reports and Data

Appendix E – Project Identification and Ranking Technical Report

Appendix F – Conceptual Project Analysis and Prioritization Technical Report

Appendix G - Project Design, Analysis, and Prioritization Results Technical Report

## **LIST OF ABBREVIATIONS**

BMP – Best Management Practice

CDPH – California Department of Public Health

CEQA – California Environmental Quality Act

City – City of Redding

CPI – Catchment Prioritization Index

DAC – Disadvantaged Communities

DEM – Digital Elevation Model

EMC – Event Mean Concentration

GIS – Geographic Information System

GSA – Groundwater Sustainability Agency

GSP – Groundwater Sustainability Plan

SWRP Guidelines – Stormwater Resource Plan Guidelines

GWBP – Groundwater Basin Plan

IRWM – Integrated Regional Water Management

IRWMP – Integrated Regional Water Management Plan

LA – Load Allocation

LPR Model – Load, Prioritization, and Reduction Model

MEP – Maximum Extent Practicable

MS4 – Municipal Separate Storm Sewer System

NGO – Nongovernmental Organization

NPDES – National Pollutant Discharge Elimination System

Outreach Plan – Stakeholder Outreach, Education, and Engagement Plan

PEAIP – Program Effectiveness Assessment and Improvement Plans

Phase II MS4 Permit – California Phase II Small Municipal Separate Storm Sewer System General Permit

QAPP – Quality Assurance Project Plan

Regional Water Board – Regional Water Quality Control Board

SBPAT – Structural BMP Prioritization and Analysis Tool

SGMA – Sustainable Management Groundwater Act

SQDV – Stormwater Quality Design Volume

State Water Board – California State Water Resources Control Board

SWGPP – Stormwater Grant Program

SWMM – Storm Water Management Model

SWRP – Stormwater Resource Plan

TAC – Technical Advisory Committee

TMDL – Total Maximum Daily Load

USGS – United States Geological Survey

WAAP – Wasteload Allocation Attainment Plan

WLA – Wasteload Allocations

## EXECUTIVE SUMMARY

This Stormwater Resource Plan (SWRP) was developed for the City of Redding (City) to identify and prioritize stormwater and dry weather runoff capture projects that provide multiple benefits, including to water quality, water supply, flood management, environment, and community. The 2014 Water Quality, Supply, and Infrastructure Improvement Act (Proposition 1) was approved to provide a source of funding to agencies for implementation of multi-benefit stormwater management projects in California. In order for projects to qualify for this funding, the Stormwater Resource Planning Act (Senate Bill 985) requires that projects be included in a SWRP.

The State Water Resources Control Board (SWRQCB) adopted the SWRP Guidelines to establish guidance for agencies developing SWRPs. This SWRP includes all required and recommended elements per the Water Code and SWRP Guidelines and will be submitted to the North Sacramento Valley Integrated Regional Water Management (IRWM) Group, thereby satisfying the Proposition 1 Stormwater Grants Program funding eligibility requirements. The SWRP Guidelines self-certification checklist, including the applicable section within the SWRP that addresses each required and recommended element, is included in Appendix A.

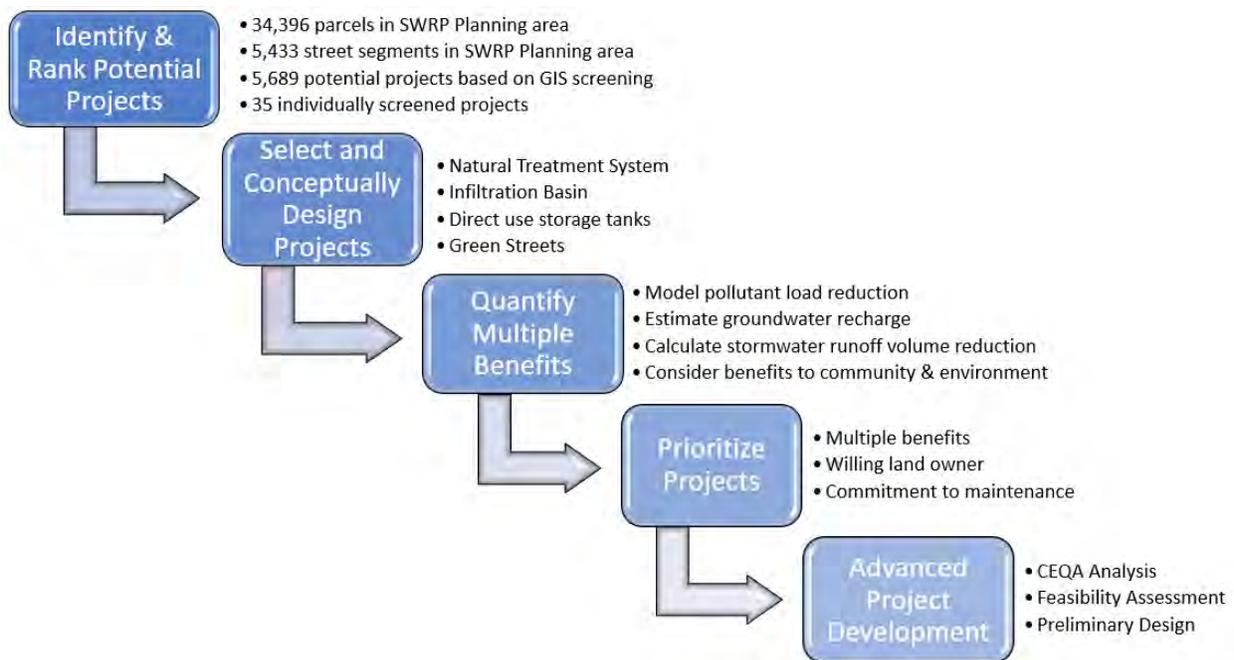

Collaboration between the City (as the Project Manager), the Technical Advisory Committee (TAC) (including State Regulators) and the stakeholders (including other public agencies, NGOs, community members, and other interested parties) was important for developing a far-sighted yet innovative SWRP that reflects local priorities. An Outreach Plan established strategies for effective engagement and community participation of local agencies and non-governmental organizations, through a variety of communication tools and well-attended public meetings.

A thorough compilation and review of existing reports relating to water management within and near the City was used as a foundation for the development of the SWRP. Relevant attributes of the three major City watersheds (Clear Creek, Churn Creek-Sacramento River, and Stillwater Creek) were characterized. These attributes include surface and groundwater resources that typically provide the area's water supply, and land development (agricultural and urban) that affect various watershed processes and may contribute to decreased water supply, increased flooding, and surface and groundwater pollution. Water quality priorities for each watershed were identified based on waterbodies with current water quality regulatory actions as well as the pollutant generating activities in each watershed, including land development.

The City is required to comply with certain water quality rules, regulations, and permits, including the California Phase II Small Municipal Separate Storm Sewer System (MS4) General Permit (Phase II MS4 Permit) (Order 2013-0001-DWQ), the Statewide Trash Provision, and the Water Quality Control Plan for the Sacramento River Basin and the San Joaquin River Basin. Through the watershed-based approach for identifying SWRP projects, using a quantification methodology that allows projects to be evaluated based on their potential ability to provide multiple benefits that address watershed-specific issues, the SWRP may assist in compliance with these various

documents. Additionally, the SWRP will contribute to achieving regional objectives established in the Northern Sacramento Valley Integrated Regional Water Management Plan (IRWMP).

A primary goal of the SWRP is to establish and apply a process to identify and prioritize, using accurate quantitative metrics, stormwater projects that address water quality concerns while providing multiple benefits. To accomplish this, an overarching project selection and development framework was developed and executed as illustrated in Figure ES-1. Projects were identified by locating publicly owned parcels (or non-public parcels with a potentially willing land owners) within the City that were suitable for project implementation. Assessment of a parcel’s suitability was based on eliminating areas characterized by a series of constraints that could inhibit or severely limit the feasibility of implementing certain project types. Additionally, project ideas were solicited from the TAC and stakeholders. Potential projects were compared to one another and ranked based on feasibility and ability to achieve the greatest benefits (Attachment E-1 contains the current ranked list of all potential projects and Attachment E-2 contains the current ranked list of individually screened projects).

**Figure ES-1. Overall SWRP Approach**

Guidance for conceptually designing projects describes how to develop basic design parameters (e.g., area draining to the project, storage capacity, depth, side slopes) and determine the project footprint based on visual assessment of site specific constraints and existing infrastructure. Various models were considered for estimating project benefits, ultimately an approach was developed for utilizing the City-specific Load, Prioritization, and Reduction (LPR) Model to quantify the potential water quality, water supply, and flood management benefits. These benefits are estimated for the average annual pollutant load reduction for twelve different pollutants, the average annual recharge volume of groundwater, and the average annual runoff volume controlled, respectively.

Projects that achieve multiple benefits support a watershed-based approach to managing stormwater and dry weather runoff as a resource rather than an environmental nuisance or flood hazard. A project prioritization approach was developed based on a projects' potential to be implemented and maintained and to achieve multiple benefits in the five benefit categories identified by the SWRP Guidelines: water quality, water supply, flood management, environmental, and community benefits. For projects with conceptual designs, modeling results are used to determine quantitative metrics for the benefit categories, which are combined with qualitative assessments of each project's benefits to determine a multi-benefit index. After multi-benefit indices are determined, projects are prioritized into low, medium, and high designations based on their multi-benefit indices and whether a willing land owner has committed to maintenance. Appendix B includes a summary table of conceptually designed, modeled, and prioritized projects, as well as two-page conceptual design and benefit summary sheets. All conceptually designed projects are also prioritized and stored in a formatted Microsoft Excel tool for easy reference.

For other project ideas that do not have a formal project concept with sufficient detail to support benefit quantification, a modified multiple benefit approach is used that is based solely on a qualitative assessment of the ability of each project idea to achieve multi-benefits. As with the conceptual projects, the "non-modeled" projects also utilized a low, medium, high prioritization. A current prioritized list of these project ideas can also be found in the Microsoft Excel tool.

To support the long-term implementation and overall effectiveness of the SWRP, a prescriptive yet flexible implementation strategy was also developed. Strategies for implementation of the SWRP include:

- identification of available and potential resources and funding,
- a schedule for major implementation activities,
- a plan for ongoing TAC and stakeholder participation,
- an adaptive formatted Microsoft Excel tool, and
- tracking and evaluation of performance measures.

The collaborative planning process resulted in the City of Redding Stormwater Resource Plan that fulfills the Water Code requirements and the primary goals (most notably addressing water quality issues in the City) of the TAC and stakeholders. Stormwater capture projects were identified, conceptually designed, quantified and prioritized resulting in a SWRP anticipated to yield multiple long-term benefits for the City and its watersheds.

## 1 INTRODUCTION

In recent years, stormwater management approaches in California have shifted from providing limited treatment and off-site conveyance to promoting watershed-based solutions that manage stormwater and dry weather runoff onsite and seek to implement treatment through projects that replicate natural hydrology and watershed processes, as well as provide multiple benefits (e.g., water quality, flood control, water supply, community, and environmental benefits). This watershed-based approach utilizes existing practices in combination with natural physical and biological functions to capture, treat, and use stormwater and dry weather runoff. This framework for stormwater management provides water quality benefits by reducing the volume of runoff and associated pollutants entering receiving waters, in addition to maintaining a healthy watershed and providing other social, community, and environmental benefits. This is the framework under which the City of Redding Stormwater Resource Plan (SWRP) was developed.

### 1.1 Regulatory Context

To provide a funding source for planning and implementation of watershed-based stormwater solutions, the Water Quality, Supply, and Infrastructure Improvement Act (Proposition 1) was approved on November 4, 2014 to provide \$200 million from the Stormwater Grant Program (SWGP) for matching grants to public agencies (among other stakeholders) to implement multi-benefit stormwater management projects in California. Prior to the passage of Proposition 1, Senate Bill 985, the Stormwater Resource Planning Act, was adopted to amend the Water Code to require the development of a SWRP in order to receive grants for stormwater and dry weather capture projects from a bond act approved after January 1, 2014. A SWRP must comply with the relevant Water Code provisions in sections 10561 through 10565, which were amended by Senate Bill 985, in order to render a stakeholder eligible for bond funds.

Proposition 1 allows up to ten percent of the designated SWGP funds for “planning and monitoring necessary for the successful design, selection, and implementation of the projects authorized...” Under this earmark, \$19 million in grant monies were made available to fund a SWRP or preparation of planning documents for a specific project. Solicitations for such monies closed on March 18, 2016 and after reviewing applications, the Division of Water Quality recommended funding for 28 projects, including the City of Redding (City) SWRP which was awarded \$89,700<sup>1</sup> for SWRP preparation.

The SWRP Guidelines (State Water Resources Control Board, 2015b) were adopted on December 15, 2015 to establish guidance for agencies developing SWRPs and serve as a guide for the State Water Board or other bond fund-dispensing agency to determine if SWRP’s adequately qualify a stakeholder to receive grant funds for stormwater and dry weather runoff projects. The SWRP

---

<sup>1</sup> To receive these funds the Grantees were required to provide matching contributions for at least 50% of the total project cost.

Guidelines provide a self-certification checklist for ensuring all required and recommended elements are completed<sup>2</sup>.

## 1.2 SWRP Purpose

This SWRP was developed for the City as a framework for ongoing identification and prioritization of stormwater and dry weather runoff capture projects that provide multiple benefits, including water quality, water supply, flood management, environmental, and community. Since no neighboring agencies had the resources or interest in funding and developing a regional SWRP, the SWRP planning area was selected to include only the area within the incorporated City (i.e., only the area where the City has jurisdiction). The SWRP planning area is shown in Figure 1.

To satisfy the Proposition 1 Stormwater Grants Program funding eligibility requirements this SWRP includes all required and recommended elements per the Water Code and SWRP Guidelines and will be submitted to the North Sacramento Valley Integrated Regional Water Management (IRWM) Group. Appendix A contains the completed SWRP Checklist and Self-Certification Form.

In addition to the meeting the SWRP Guidelines, the City, the Technical Advisory Committee (TAC), and the stakeholders discussed and highlighted goals that were of special importance in developing and implementing the SWRP (see Sidebar). These primary goals steered the customized development the SWRP.

### Primary goals of the SWRP

- Provides a forward-thinking and living framework for implementation
- Emphasizes water quality
- Identifies projects that bring value and benefit to the community
- Collaboratively developed and implemented
- Has local project support
- Provides opportunities for community education
- Prepares opportunities for future grant funding

---

<sup>2</sup> The SWRP is also reviewed by the State Water Board and Regional Water Board, for consistency with these guidelines and the checklist.

State and regional requirements and objectives were also considered during SWRP development. Stormwater discharges from the City are regulated by the California Phase II Small Municipal Separate Storm Sewer System (MS4) General Permit (Phase II MS4 Permit) (Order 2013-0001-DWQ) (State Water Board, 2013), and may be affected by Total Maximum Daily Loads (TMDLs) for watersheds that encompass the City. Effective SWRPs and implementation of associated projects could support compliance with the Phase II MS4 Permit and TMDL requirements.

**Figure 2. Boulder Creek Elementary Flooded (KRCR News February 2017)**

The Sustainable Management Groundwater Act (SGMA), enacted in 2014, requires locally governed Groundwater Sustainability Agencies (GSAs) to develop Groundwater Sustainability Plans (GSPs) to effectively study and manage groundwater resources. The ultimate SGMA objective is to reach sustainable groundwater conditions within 20-years of implementing the GSP. Effective SWRPs and implementation of associated projects could support GSAs to achieve GSP goals to augment and diversify local/regional water supplies. Stormwater capture and infiltration is an option for recharging local groundwater supplies.

Additionally, the Northern Sacramento Valley IRWMP (West Yost Associates, 2014) identifies regional objectives that include water supply reliability, flood protection and planning, and water quality protection and enhancement. The Redding Basin Water Resources Management Plan Environmental Impact Report (CH2MHILL, 2007) also identifies regional objectives that include protecting and augmenting water supplies, and protecting and improving water quality. This SWRP's watershed-based approach identifies and prioritizes stormwater management projects with multiple benefits that will directly address these regional objectives.

### **1.3 SWRP Overview**

This SWRP contains the main sections outlined below. References to relevant Water Code requirements are included throughout to demonstrate compliance.

- **Section 2 – Organization, Coordination, and Collaboration:** describes the overarching organization of agencies developing the SWRP and the community engagement process that occurred during plan development, including identification of stakeholders, the mechanisms and processes used to engage the public, and a summary of the stakeholder participation.
- **Section 3 – Background:** summarizes the general information contained within relevant reports and datasets, describes the relationship of the SWRP to other existing planning documents, ordinances, and programs established by local agencies, identifies watersheds

and subwatersheds within the SWRP area, summarizes existing water quality issues and potential causes of impairments within the major watersheds, including 303(d) listings and TMDLs, and describes existing permits and plans relevant to the SWRP and how the SWRP will be consistent, and assist in compliance, with these requirements.

- **Section 4 - Identification and Prioritization of Projects:** discusses the overall approach used for identification and prioritization of projects. Includes the evaluation of potential models for quantifying multiple benefits of projects, process of conceptual project selection, conceptual designs for each project, the methodology and results for quantification of the multiple benefits of conceptual projects, and prioritization of projects.
- **Section 5 - Implementation Strategy and Schedule:** describes the processes for the SWRP projects to be implemented in the future, including ongoing coordination, an implementation schedule, resources for SWRP implementation, tracking project status, an adaptive management approach, strategy for obtaining necessary permits, potential monitoring needs, and data management.

## 2 ORGANIZATION, COORDINATION, AND COLLABORATION

The collaboration of the City (as the Project Manager), the TAC (including various departments within the City) and stakeholders (including other local agencies, NGOs, community members, etc.) have been integral to the development of a far sighted yet implementable SWRP that is representative of local priorities (Figure 3).

This section of the SWRP describes the organization and roles of the SWRP developers and the community engagement process that occurred during SWRP development, while Section 5.4 describes the plan for ongoing collaboration during the SWRP implementation.

### 2.1 Organization of the SWRP Developers

The City served as the lead agency for SWRP development and was responsible for managing SWRP development and the State Grant agreement, in addition to coordinating collaboration of the TAC, stakeholders, and consultants. The City also contributed financially and with in-kind time directly to development of the SWRP.

To support the development and implementation of the SWRP, a TAC was established to provide oversight and review during the development process. The TAC is comprised of various departments within the City. Each member represented specific interests and was helpful in both soliciting and conveying their agency’s priorities and in communicating important information to their specific public audience. At regularly scheduled meetings and through email communication, the TAC assisted with important decisions and provided necessary feedback and guidance. The name, affiliation, and contact information for each TAC member is listed in Table 1.

### Relevant California Water Code Requirements

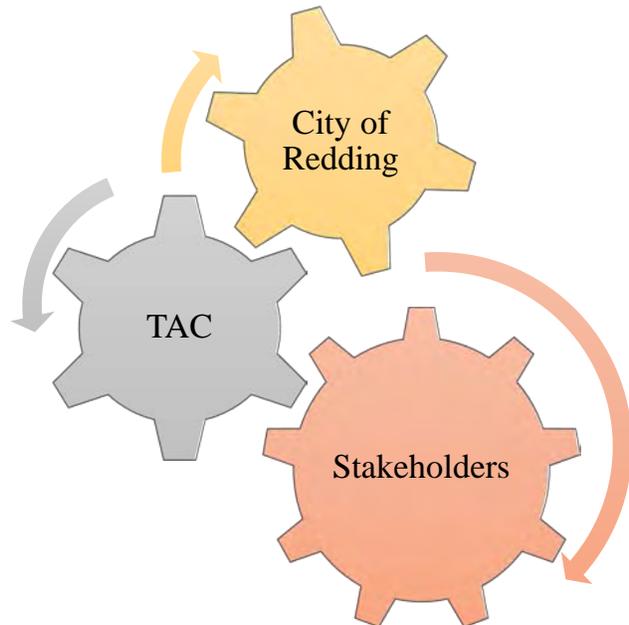

- Section 10565(a) requires that local agencies and nongovernmental organizations (NGOs) be consulted in the SWRP development.
- Section 10562(b)(4) requires that a stormwater resource plan shall provide for community participation in plan development and implementation.

**Table 1. TAC Members**

Christina Piles	Redding Solid Waste	cpiles@cityofredding.org
Bryant Garrett	Redding Airports	bgarrett@cityofredding.org

The key roles and responsibilities of the TAC included the following:

- participation in the TAC kickoff meeting (to establish project goals and roles) and three progress meetings (to provide updates on the development of the SWRP and to solicit input and feedback),
- participation in the three stakeholder/public outreach meetings,
- making decisions regarding project modeling and design priorities,
- providing experienced knowledge and understanding of local infrastructure, hydrology, groundwater, and potential project constraints,
- soliciting feedback from others within their agency regarding feasibility of potential projects,
- providing timely responses to data requested for the development of the SWRP, and
- reviewing the administrative draft and final draft SWRP.

**Figure 3. Collaboration of key groups during the SWRP development**

Effective stormwater planning and management on a watershed level includes collaboration of local and regional governments, utilities, and other stakeholder groups. Therefore, numerous agencies and other groups were involved in the development of the SWRP. Interested stakeholders provided valuable input into the planning process and informed potential project opportunities. The stakeholders were individuals, groups, coalitions, agencies, and other entities that were involved in, affected by, or had an interest in the implementation of the SWRP. Appendix C contains a list of stakeholders involved in the development of the SWRP and their contact information.

The roles and responsibilities of the stakeholders included the following:

- providing input into development of the SWRP,
- attending public meetings,
- recommending potential locations for project development,
- providing local knowledge and input regarding conceptual project designs,
- commenting on draft sections of the SWRP, and
- providing letters of support for the SWRP and projects.

## **2.2 Stakeholder Identification, Engagement, and Participation**

The Stakeholder Outreach, Education, and Engagement Plan (Outreach Plan) is included in Appendix C and summarized briefly in this section. The Outreach Plan establishes strategies for effective engagement, in order to meet or exceed the requirements for consultation of local agencies and NGO's (Water Code Section 10565[a]) and community participation (Water Code Section 10562 [b][4]) in SWRP development and implementation as well as the additional elements listed in the SWRP Guidelines Section VI.B and VI.F.

The Outreach Plan outlines a variety of communication systems that were used to disseminate information about the SWRP, in part relying on groups that have similar concerns and issues as those addressed in the SWRP. Public outreach and involvement was sustained throughout the development of the SWRP with the intention of forming alliances that further the goals and sustainability of the SWRP and projects. Section 5.4 below discusses how public engagement will be continued through the implementation of the SWRP.

Public meetings are an established and effective mechanism to engage communities in planning efforts and projects. The first stakeholder meeting was held on January 11, 2018, with over ten stakeholders attending the meeting. An overview of the SWRP process and the draft project identification and ranking was presented. Additionally, attendees were requested to submit other potential locations and projects for consideration. At the second stakeholder meeting, held on March 1, 2018, an overview of the SWRP conceptual projects was presented, including a discussion of the project descriptions, benefits, and prioritization results. Stakeholders present during this meeting were able to provide comments and feedback on the draft conceptual projects. The third (and final) stakeholder meeting, was held on June 6, 2018. During the meeting, an

overview of the draft public SWRP was presented and discussed along with the findings of the feasibility assessment and initial design considerations for three of the conceptual projects (the sewer ponds, Mary Lake, and Pine-Market Alley). A draft public SWRP was provided to the stakeholders on July 11 for a two-week comment period and all comments were reviewed and incorporated (as appropriate) in the final draft SWRP. Records from the stakeholder meetings, including the meeting advertisement, attendees sign-in sheets, and presentations are included in Appendix C.

A large part of the SWRP planning area contains economically disadvantaged communities (DAC) and economically distressed areas (EDA): approximately 49 percent of the area (and 72 percent of the population) within the City is disadvantaged<sup>3</sup> including 25 percent (and 36 percent) that is considered severely disadvantaged. The Outreach Plan describes an approach to identify DACs that have an interest and stake in the planning outcome. Participation from DAC community representatives at the public workshops provided opportunities to identify and address specific runoff-related environmental justice issues.

---

<sup>3</sup> Based on the 2014 American Community Survey median household income by census block group. The severely disadvantaged area is a subset of the disadvantaged area. Disadvantaged areas have a median household income of less than 80% of the state's median household income, while severely disadvantaged areas have less than 60%. This corresponds to a median income below \$49,191 in disadvantaged areas and below \$36,893 in severely disadvantaged areas.

### 3 BACKGROUND

#### 3.1 Existing Relevant Reports and Data

Numerous reports have been developed by the City and other stakeholders relating to water management within the SWRP planning area. A thorough understanding of this applicable information was a critical starting point in the development of the SWRP (as required by Section VI.B of the SWRP Guidelines). These reports were used throughout all stages of the SWRP development. Examples of how the SWRP drew from previous reports and data include:

- the project rankings considered land use, proximity to surface water and groundwater resources, surface water and groundwater quality issues, soil characteristics, and existing stormwater infrastructure, among other factors; and
- potential projects that were previously identified (e.g., Downtown Mall Alley) were included in the project quantification and prioritization process.

Table 2 includes a summary of the general categories of information that are contained within relevant reports. Appendix D contains a description of each report and identifies the specific relevant information.

By identifying and ranking potential stormwater and dry weather management projects, the SWRP contributes to water supply, water quality, flood management, environmental, and community enhancement (i.e., recreational areas, open space, etc.) goal attainment established in other planning documents, ordinances, and programs. This includes the IRWMP (water supply, water quality, flood management, environmental, and community enhancement goals), the comprehensive stormwater management plan (water quality goals), the stormwater management plans and Program Effectiveness Assessment and Improvement Plan<sup>4</sup> (PEAIP) (water quality goals), and the groundwater management plan (water quality and water supply goals). Additional discussion of how the SWRP connects with the water quality goals of many of these planning documents is included in Section 3.3.

---

<sup>4</sup> A requirement of the Phase II MS4 Permit intended for MS4 Permittees to assess the status of compliance with permit conditions, the appropriateness of identified control measures, and progress towards measurable goals.

### 3.2 Watershed Characterization

As required by Water Code Sections 10565(c) and 10562(b)(1), the SWRP planning area was divided into the three watersheds and 18 subwatersheds that pass through the City. The watersheds include the following:

- Churn Creek-Sacramento River watershed (51 sq. mi of which is in the SWRP planning area, or 29% of the total watershed area);
- Clear Creek watershed (2.7 sq. mi of which is in the SWRP planning area, or 1.1% of the total watershed area); and
- Stillwater Creek watershed (7.3 sq. mi of which is in the SWRP planning area, or 11% of total watershed area).

The subsequent information presented in this section fulfills requirements in Section VI.A of the SWRP Guidelines. These watersheds were selected because they encompass the City and are based on the United States Geological Survey (USGS) hydrologic unit code (HUC)-10 watersheds (defined as the “watershed” watershed level). The USGS HUC-10 watershed definition provides the largest practical definition that allows for comprehensive and integrated stormwater management. A Roadmap to Watershed Management<sup>5</sup> and North Sacramento Valley IRWMP<sup>6</sup> provide a description of these watersheds including: watershed geography, management issues (e.g. water quality, water supply, flood management), flow characteristics, vegetation, and habitat. The subwatersheds were defined by areas draining to major creeks as identified in the Redding Stormwater Quality Improvement Plan<sup>7</sup>, which also provides a description of these subwatersheds including: watershed geography, flow characteristics, land use, and habitat.

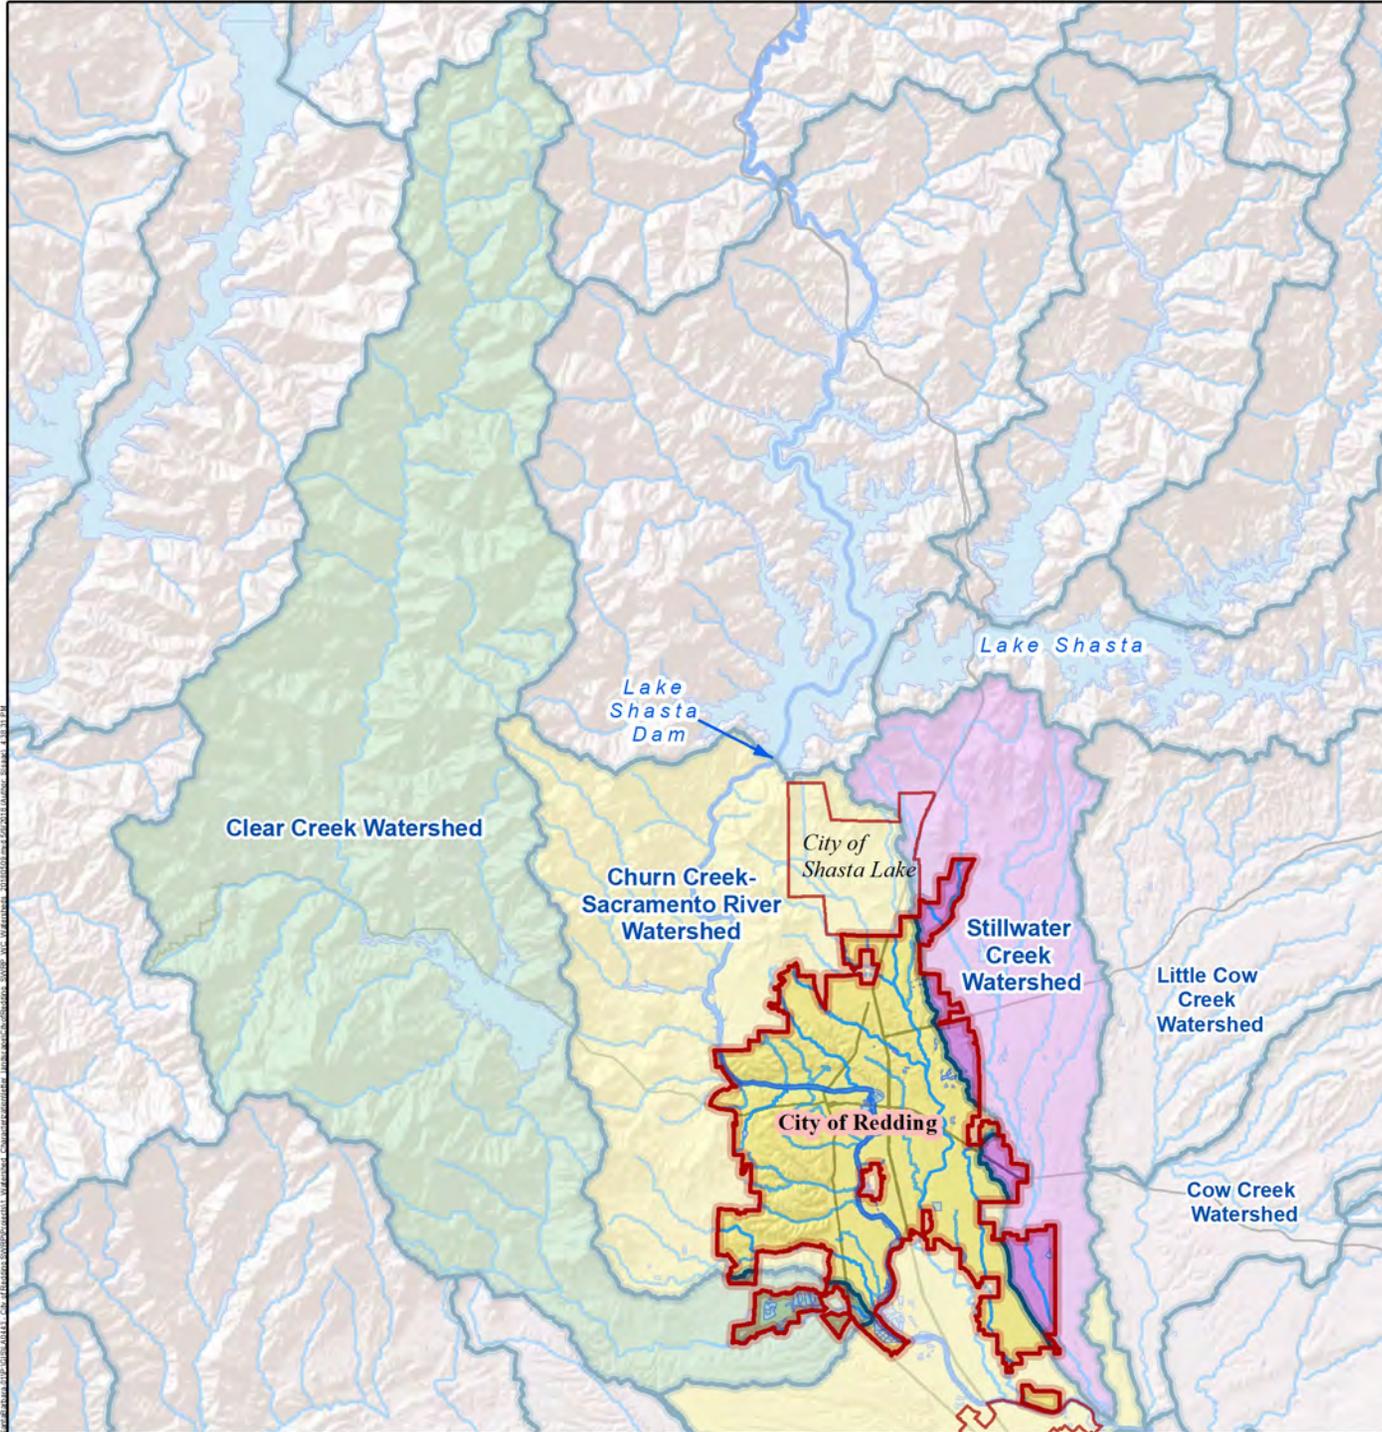

In addition to the reasons stated above, the selected watersheds and subwatersheds also provide an appropriate scale for the quantitative analyses of stormwater runoff and pollutant loading. The SWRP approach quantifies multiple benefits for projects, to allow comparison within the same watershed or subwatershed, and this comparison can incorporate water quality priorities by watershed or subwatershed (e.g., TMDLs). Additionally, by utilizing the smaller subwatersheds, the impact a project could have on local issues can be better understood. The watersheds and subwatersheds are indicated in Figure 4 and Figure 5, respectively.

The groundwater basins and reservoirs/lakes that reflect the water resources present within the SWRP planning area are shown in Figure 6. The Sacramento River and Whiskeytown Lake provide 74 percent of the City’s annual water supply, with groundwater providing the remaining 26 percent. The surface water and groundwater sources generally have high-quality water, with a few groundwater locations having elevated arsenic and manganese concentrations (City of Redding, 2016b). The Redding 2015 Urban Water Management Plan<sup>8</sup>, Redding Storm Water Quality Improvement Plan<sup>9</sup>, Redding Groundwater Basin Plan<sup>10</sup>, and North Sacramento Valley IRWMP<sup>11</sup> describe the groundwater basins (including size, water quality, and overlaying land use), and the surface water infrastructure (including water quality, reservoir storage capacity, and associated distribution systems) in more detail.

The City of Redding Water Utility, Anderson-Cottonwood Irrigation District (ACID), Bella Vista Water District (BVWD), and Centerville Community Services District (Centerville CSD) provide water service within the Redding SWRP planning area. Their jurisdictional boundaries are shown on Figure 6 and the estimated volume supplied are shown in Table 3.

**Table 3. Estimated Volume of Potable Water Provided within the SWRP Planning Area**

Development (including urbanization, agriculturalization, and mining activity) within the watersheds has significantly altered various watershed processes and in some areas resulted in increased flooding and surface water pollution, while decreasing water supply resources. To address these impacts the SWRP utilizes watershed-based natural solutions to capture, treat, and use stormwater and dry weather runoff. Figure 8 and Figure 9 show the existing land cover and land use, including native habitats, parks, and other open space. Additionally, the City of Redding 2000-2020 General Plan<sup>12</sup> and Sacramento River Watershed Program<sup>13</sup> describe the significant ecological processes occurring within the SWRP planning area which might need additional protection from watershed-altering processes, including sensitive aquatic species, freshwater habitats, vernal pools, and areas of special biological significance.

Prior to development, storm event peak flows were moderated by infiltration, evaporation, and transpiration, such that overland runoff did not commonly occur during small to medium storm events. Instead, the majority of precipitation was infiltrated and conveyed by shallow subsurface flow and groundwater or stored within vegetation or surface depressions. Development of an area increases impervious cover through roadways, parking lots, buildings, and other impervious surfaces. With development, natural drainage systems were replaced with pipe or ditch/channel system. Additionally, the clearing of native vegetation for development reduces the interception storage available for precipitation, and site grading eliminates natural depressions for precipitation storage. Post-development surface runoff can peak in the drainages dramatically during storm events, since not as much of the precipitation is able to infiltrate through soils. Even areas such as parks have reduced infiltration capacity because topsoil was removed and compacted, which retards infiltration capacity. With less infiltration, shallow subsurface flow and groundwater flow was also reduced and therefore, less groundwater is available to maintain streamflow during the dry summer months and increased surface runoff and stream erosions result in more “flashy” streamflows and higher flooding risks.

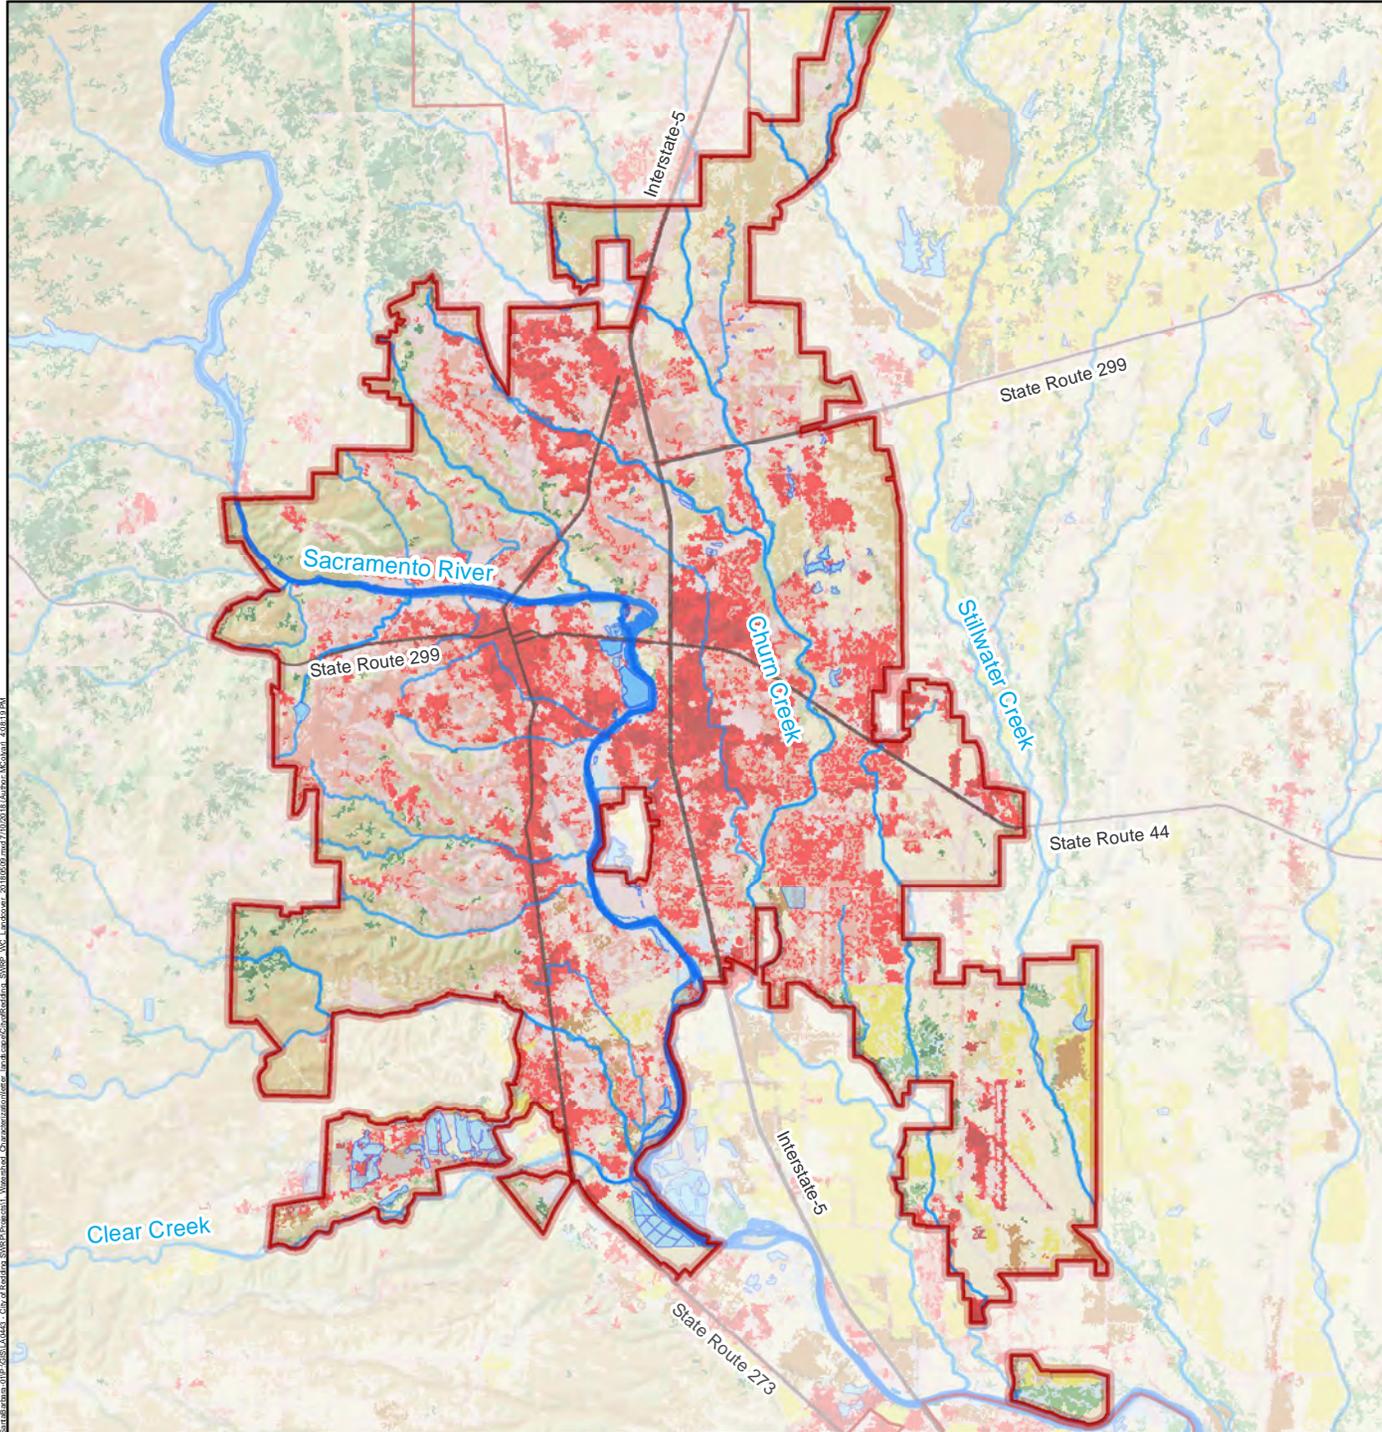

**Figure 7. Localized flooding intensified by urban development**

<sup>12</sup> City of Redding 2000-2020 General Plan, Natural Resources Element, pages 1 through 15.

<sup>13</sup> A Roadmap to Watershed Management, pages 51-55 and 85-89.

Development also contributes to degraded water quality because of the various urban activities that contribute higher levels of pollutants than the natural watershed condition. Runoff from watersheds carry contaminants associated with mining, urban development, industrialization, agriculture, and atmospheric deposition to local receiving water bodies. As described above, development increases surface runoff during storm events, increasing pollutant loads transported to receiving waters. Non-urban uses such as agriculture also contribute higher stormwater pollutant loads than the natural watershed, due to the use of fertilizers and/or pesticides. Mining, especially of copper, gold, and mercury, exposes and mobilizes previously buried material and degrades water quality by increasing concentrations of mercury, acidity, and sediment load. Even after mining activity ceases, precipitation and surface runoff continue to leach pollutants from the disturbed areas and can degrade both surface and groundwater. Additionally, development reduces the presence of natural pollutant remediation processes that are present in natural habitats. Figure 8 and Figure 9 indicate the urbanized and agricultural areas that are potentially pollutant generating.

In addition to land use changes altering flow patterns, the construction of Shasta Dam as part of the Bureau of Reclamation Central Valley project has changed the seasonal flows within the Sacramento River. The dam stores water during the typical high flow winter period and releases the water later in the year to support beneficial uses in the area. Damming a river alters the nutrient, pollutant, and temperature dynamics downstream of the dam. Nevertheless, overall post-development changes in hydrologic processes are mostly attributed to the loss of natural land cover, an increase in impervious surfaces, and channelization of natural drainage courses. The areas identified with “developed” land covers, as shown in Figure 8, are most likely to exhibit these aforementioned changes in watershed processes. Areas of the watershed that are classified as forest, shrub/scrub, herbaceous, or other natural land cover type, are likely maintaining natural watershed processes (or conditions close to the natural conditions).

### 3.2.1 Water Quality Priorities

As described in Section 3.2, mining, agriculture, and urban development within the watersheds have contributed to degraded water quality because of the various activities that contribute higher stormwater pollutant loads than the natural watershed condition. The Phase II MS4 permit identifies common urban pollutant sources and pollutants, while various existing reports (as described in Section 3.1) identify pollutant generating activities specific to the SWRP planning area watersheds. The water quality priorities of the watersheds have been further identified through various ongoing monitoring programs conducted by the City and other stakeholders. This section fulfills requirements in Section VI.A of the SWRP Guidelines.

The Phase II MS4 Permit states the following:

*Finding 2. As human population increases, urban development creates new pollution sources and brings with it proportionately higher levels of car emissions, car maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, trash, etc. which can either be washed or directly dumped into the municipal separate storm sewer system (MS4). As a result, the runoff leaving the developed urban area is greater in pollutant load than the pre-development runoff from the same area. Also, when natural vegetated pervious ground cover is converted to impervious surfaces such as paved highways, streets, rooftops, walkways and parking lots, the natural absorption and infiltration abilities of the land are lost. Therefore, runoff leaving developed urban area is significantly greater in runoff volume, velocity, peak flow rate, and duration than pre-development runoff from the same area. The increased volume, velocity, rate, and duration of runoff greatly accelerate the erosion of downstream natural channels. In addition, the greater the impervious cover the greater the significance of the degradation.*

*Finding 3. Pollutants of concern found in urban runoff include sediments, non-sediment solids, nutrients, pathogens, oxygen-demanding substances, petroleum hydrocarbons, heavy metals, floatables, polycyclic aromatic hydrocarbons (PAHs), trash, pesticides and herbicides.*

*Finding 4. Trash and litter are a pervasive problem in California. Controlling trash is a priority, because trash adversely affects our use of California's waterways. Trash impacts aquatic life in streams, rivers, and the ocean as well as terrestrial species in adjacent riparian and shore areas. Trash, particularly plastics, persists for years. It concentrates organic toxins, entangles and ensnares wildlife, and disrupts feeding when animals mistake plastic for food and ingest it. Additionally, trash creates aesthetic impacts, impairing our ability to enjoy our waterways.*

As required by Water Code Section 10562(d)(7), Table 4 lists the potential pollutant generating activities identified for each of the watersheds.

**Table 4. Pollutant Generating Activities**

<sup>a</sup> Sources identified in the PEAIIP, TMDL staff reports, City of Redding Storm Water Quality Improvement Plan, A Roadmap to Watershed Management, and Final California 2014 and 2016 Integrated Report (303(d) List/305(b) Report)

Monitoring water quality at groundwater, receiving water, and MS4 outfall locations provides information regarding water quality issues in the SWRP planning area. Relevant ongoing monitoring programs conducted in the City include the following:

- **Groundwater monitoring:** The Shasta County Water Agency (SCWA) developed a groundwater basin plan (GWBP) for the Redding Groundwater Basin, which was adopted in 1998 and last updated in May 2007 (SCWA, 2007)<sup>14</sup>. The GWBP includes a monitoring program that collects data from 48 wells located throughout the basin. Water level data are collected semi-annually for some and quarterly for other wells. Groundwater and surface water supply data are also collected, compiled and assessed in biannual reports. Water level data are used to develop hydrographs and contours of groundwater surface elevations.

A regional groundwater level monitoring program is also conducted by USGS at three wells in Shasta County. Groundwater elevation records are stored in digital form and well locations are in a Geographic Information System (GIS) database<sup>15</sup>.

California’s Groundwater Bulletin 118 (2004) reports the active groundwater monitoring programs in the Redding Groundwater Basin listed in Table 4 and summarizes the groundwater quality in each. The Enterprise subbasin has high levels of total dissolved solids and chlorides in the lower formations (Tehama and Tuscan), while sodium and boron are found in the upper formation (Chico). Iron and manganese are also elevated at localized spots in the subbasin. The Anderson subbasin also has localized areas of high iron, manganese, and nitrate concentrations. The Millville subbasin has sodium and boron in the upper formation (Chico) and iron and manganese are also elevated at localized spots in the subbasin.

<sup>14</sup> A description of the monitoring program is included on pages 13-18.

- **Sacramento River Monitoring:** There are numerous monitoring programs throughout the Sacramento River Basin. Some are citizen-led efforts while others are watershed-specific monitoring programs. The majority of locations sampled by these programs are well downstream of the City, however, several overlap with the SWRP planning area. The Irrigated Lands Regulatory Program (ILRP) monitoring occurs throughout the basin to assess impacts from agricultural runoff by testing for pesticides, metals, nutrients, toxicity, pathogens, and general chemistry and physical parameters. The monitoring results are submitted to the Central Valley Regional Water Quality Control Board in an annual report. The Sacramento Watershed Coordinated Monitoring Program (SWCMP) is conducted by the Department of Water Resources (DWR) and Central Valley Regional Water Quality Control Board at locations throughout the river basin, with several sites in or near the City of Redding. Parameters monitored and reported in the DWR’s Water Data Library include temperature, dissolved oxygen, nutrients, metals, and bacteria, among other physical, chemical, and biological parameters. Some locations are also monitored for macroinvertebrate populations and toxicity. Metal concentrations in the Sacramento River are highest during winter months likely due to high concentrations of metals in stormwater runoff from urban areas and large rain events causing Keswick Dam to release more water, which also has higher metal concentrations likely due to upstream mining operations.

Based on monitoring that has been conducted within the SWRP planning area, some waterbodies have been identified on the 2016 California Clean Water Act Section 303(d) list of water quality impaired segments. Two of the watersheds within the SWRP planning area contain waterbodies that are 303(d) listed (5 receiving waters) and one watershed has TMDLs (1 receiving water). TMDLs are numerical calculations of the maximum amount of a pollutant that a waterbody can receive and still meet water quality standards, including an allocation of that amount to the pollutant’s sources. TMDL WLAs and WQO standards are established to protect all related beneficial uses. The Sacramento River is subject to the diazinon and chlorpyrifos basin plan

amendment<sup>16</sup> and TMDLs<sup>17</sup> for cadmium, copper and zinc (although the City is not designated as a responsible party). TMDLs for other pollutants are expected to be completed soon based on Table 6.

The impaired waterbodies are shown in Figure 10, and Table 6 summarizes the waterbodies that are 303(d) listed. These 303(d) listings and other common urban pollutants will inform the water quality priorities for each watershed that will be considered in the development of the SWRP. TMDLs would also be used to inform water quality priorities as they are established. The GWBP<sup>18</sup> describes the specific groundwater quality issues associated with each groundwater basin by watershed.

**Table 6. 303(d) and TMDL Pollutants by Watershed and Pollutant Category**

Watershed	Water Body	Pollutant	Expected TMDL Completion*	TMDL Effective Date
<b>Churn Creek-Sacramento River</b>	Spring Creek, Lower (Iron Mountain Mine to Keswick Reservoir)	Acid Mine Drainage	2027	not completed

<sup>18</sup> Physiography and Geology section

features essential to the conservation of that species. Western parts of the City are home to critical habitat for slender Orcutt grass, vernal pool fairy shrimp, and vernal pool tadpole shrimp. Many of the streams in the City are critical habitat for steelhead and chinook salmon. These areas are shown in Figure 10 and summarized in Table 7 below.

**Table 7. Critical Salmonid Stream Habitats**

### 3.3 Water Quality Compliance

The SWRP identifies strategies to address water quality compliance requirements, fulfilling the relevant water code requirements (see Sidebar). There are several permits or documents that the City is required to comply with, including the Phase II MS4 Permit, Statewide Trash Amendments, and TMDLs. The SWRP will assist in compliance with these various documents, as described herein.

The City is required to comply with the Phase II MS4 Permit. The following provisions of the Phase II MS4 Permit are informed and may be assisted by the identification and prioritizations of projects conducted for this SWRP:

- Provision B, which prohibits “discharges of stormwater from the MS4 to waters of the U.S. in a manner causing or threatening to cause a condition of pollution or nuisance”,
- Provision C, which requires the permittees to implement controls to reduce the discharge of pollutants from their MS4s to the Maximum Extent Practicable (MEP),
- Provision D, which states that “discharges shall not cause or contribute to an exceedance of water quality standards contained in a Statewide Water Quality Control Plan, the California Toxics Rule, or in the applicable Regional Board Basin Plan.”, and
- Provision E.14.a, Program Effectiveness Assessment and Improvement, which requires the development of a PEAIIP and quantitative effectiveness assessment. The model used to quantify the effectiveness of the SWRP conceptual projects is also being used for assessing the effectiveness of the PEAIIP. The conceptual projects were developed, and their conceptual design parameters were used in the model to determine the average annual baseline stormwater runoff volume and pollutant loads (based on applicable priority pollutants) to the BMP and the runoff volume and load reductions resulting from the BMP.

Traditional approaches to stormwater management do not fully address water quality impacts from stormwater discharges or necessarily provide multiple benefits such as water supply augmentation and ecological enhancement of the local watersheds. The SWRP utilizes a watershed-based approach to stormwater management that will identify multi-benefit projects that can yield water quality benefits by reducing the volume of runoff delivered to receiving waters, thus reducing the pollutants discharged from urban and/or agricultural areas while augmenting needed water supplies. In areas where stormwater infiltration is not feasible (e.g., high groundwater, low

#### Relevant California Water Code Requirements

- Section 10562(b)(5) requires that the SWRP is consistent with, and assists in, compliance with TMDL implementation plans and applicable National Pollutant Discharge Elimination System (NPDES) Permits.
- Section 10562(b)(6) requires that the SWRP identifies applicable permits and describe how the SWRP meets all applicable waste discharge permit requirements.

infiltration rates, steep slopes, landslide or liquefaction risk zones), projects may use natural treatment systems to reduce pollutant concentrations in runoff. Watershed-based approaches to stormwater management also provide non-measurable social and community benefits that traditional management approaches do not provide, such as new or enhanced recreational and public use areas. Through this watershed-based approach, the SWRP will assist the City in demonstrating compliance with the Phase II MS4 Permit.

The SWRP quantifies the water quality benefits of the top selected projects in terms of volume reduction and reductions in 12 pollutants using the Load, Prioritization, and Reduction (LPR) Model (Geosyntec Consultants, 2017). The projects are then assigned water quality scores based on the estimated pollutant reductions, with pollutants that are 303(d) listed or have applicable TMDLs weighted such that higher reductions in these priority pollutants produces a higher overall water quality score. This process allows projects to be evaluated based on their potential ability to improve water quality for watershed specific water quality issues.

As such, the SWRP estimates water quality benefits to the City achievable through project implementation and will support other water quality improvement efforts including Phase II Permit compliance demonstration, compliance with TMDL Waste Load Allocations (WLAs), and helping restore beneficial uses of 303(d) listed waterbodies.

In addition, depending on the types of projects identified, SWRP projects may also support implementation of the Statewide Trash Amendments<sup>19</sup>. The State Water Resources Control Board has indicated that the following types of BMPs will be considered full capture systems (identified as Multi-Benefit Treatment Systems):

- bioretention,
- capture and use,
- detention basin,
- infiltration trench,
- infiltration basin, and
- media filter.

Table 8 summarizes how the SWRP will assist in compliance of the Phase II MS4 Permit, in addition to 303(d) listed water body-pollutant combinations.

Water Quality Control Plan	All Watersheds with MS4 discharges	Trash	Identifies potential projects that would capture and remove trash from stormwater runoff
TMDLs	Churn Creek-Sacramento River	Cadmium, Copper, Zinc	Identifies potential projects that would remove (infiltrate or directly use) or treat stormwater runoff resulting in lower pollutant loads to receiving waters (aids in the goal of compliance with TMDL WLAs and Water Quality Objectives)
303(d) listings (impaired waters)	Churn Creek-Sacramento River	Unknown Toxicity	
		Clear Creek	Mercury

<sup>1</sup> The Regulated Facility Report was generated on CIWQS on 5/10/2018. Regional Boards are in the process of entering backlogged data. As a result, data may be incomplete.

#### 4 IDENTIFICATION AND PRIORITIZATION OF PROJECTS

The main purpose of the SWRP is to identify and prioritize potential projects within the SWRP planning area that capture and use stormwater and other discharges. These potential projects must meet one or more of the criteria established for project selection included in the Water Code<sup>20,21</sup> and the SWRP Guidelines. These criteria include projects that:

- augment local water supply (Water Code 10562(d)(1)),
- provide source control of pollution from both stormwater and dry weather runoff, onsite and local infiltration, and use of stormwater and dry weather runoff (Water Code 10562(d)(2)),
- reestablish natural water drainage treatment/infiltration systems or mimic natural system functions to the maximum extent feasible (Water Code 10562(d)(3)),
- develop, restore, or enhance habitat and open space through runoff management including wetlands, riverside habitats, parkways, and parks (Water Code 10562(d)(4)), and
- use existing publicly owned lands (Water Code 10562(d)(5) and 10562(b)(8)).

A variety of stormwater and dry weather runoff capture project types are suitable for fulfilling the criteria listed above, while aligning with the SWRP primary goals, including infiltration, direct use, treatment, and restoration. These project types are typically categorized based on the scale of implementation, as either distributed BMPs or regional BMPs. Distributed BMPs are designed to treat runoff from smaller drainage areas (less than 10 acres) and are normally installed to collect runoff close to the source from a limited number of parcels. Regional BMPs are designed to treat runoff from a large drainage area (greater than 10 acres) and are expected to include multiple parcels and various land uses.

Distributed BMPs, such as curb cuts, swales, rain gardens, deep mulch, green streets, and rain barrels, are effective methods for treating relatively small quantities of runoff volumes locally and play an important role in a stormwater management. Such BMPs are often initiated at a grass-root level, are community-driven, and are important for increasing public awareness and involvement in addition to water quality improvements. However, to meet the criteria outlined in the Water Code and SWRP Guidelines in the most cost-effective way with the public funding involved, the identification and prioritization of the SWRP projects generally focuses on large-scale regional

---

<sup>20</sup> Additionally, the Water Code requirements (10727.4.(e),(f),(h),(i),(k)) discuss additional elements of a GSP that were considered during this SWRP development

<sup>21</sup> For new and redevelopment projects, post-construction requirements are contained in the City's Post-Construction Standards Plan (City of Redding, 2016a). The Post-Construction Standards Plan identifies design criteria and best management practices to prevent storm water and dry weather runoff pollution and increase effective storm water and dry weather runoff management for new and upgraded infrastructure and residential, commercial, industrial, and public development in compliance with Water Code 10562(d)(6). Therefore, these projects are not addressed within this SWRP.

BMPs such as infiltration basins, direct use, and treatment systems. These regional BMP types are scaled larger for their treatment areas and score the highest for meeting multiple objectives of augmented water supply, reducing pollutant loadings, mitigating flood risks, etc. The exception is the identification and prioritization of green street projects, which although they are categorized as distributed BMPs, provide the City the opportunity of incorporating the designs into planned or future road improvement projects as they are available.

Project identification was conducted in two ways during the SWRP development. The first approach began by identifying publicly owned parcels<sup>22</sup> within the SWRP planning area that were suitable for BMP implementation, followed by ranking of these identified projects based on feasibility and ability to achieve the greatest benefits, as summarized in Section 4.1 and described in detail in Appendix E. The second approach consisted of soliciting input from the TAC and stakeholders to leverage their local knowledge to identify potential project locations. The current lists of identified and ranked potential projects are included as attachments to Appendix E and will be updated as additional evaluations of potential projects are conducted. Additionally, the identified and ranked projects are included in a Microsoft Excel file and two GIS shapefiles<sup>23</sup> for the easy review and the inclusion of new projects.

To prioritize potential projects according to the multiple benefits they provide (e.g., water quality, flood management, water supply, environmental, and other community benefits), the SWRP includes an approach to:

- conceptually design potential projects (Section 4.2, described in detail in Appendix F),
- model and quantify each project’s multiple benefits (Section 4.3, described in detail in Appendix F), and
- prioritize projects based on their potential to be implemented and maintained, and the benefit score of measurable factors (e.g., pounds of pollutants removed, volume water supplied) (Section 4.4, described in detail in Appendix F).

This process, from identification of projects to prioritization of conceptually designed projects, is outlined in Figure 11.

The current projects that have been conceptually designed, modeled, and prioritized are described in detail in Appendix G and compiled in the Redding SWRP Project Prioritization Tool (Prioritization Tool) (Section 5.5). Appendix G is intended to function as a living document, in which the conceptual design details of projects and the quantified potential benefits are updated as they become available.

---

<sup>22</sup> Privately owned parcels with willing land owners are also suitable, so parcels owned by the McConnell Foundation were also included for consideration.

<sup>23</sup> Available for download at the City Stormwater Management website: [www.cityofredding.org/departments/public-works/environmental-management/storm-water-management](http://www.cityofredding.org/departments/public-works/environmental-management/storm-water-management)

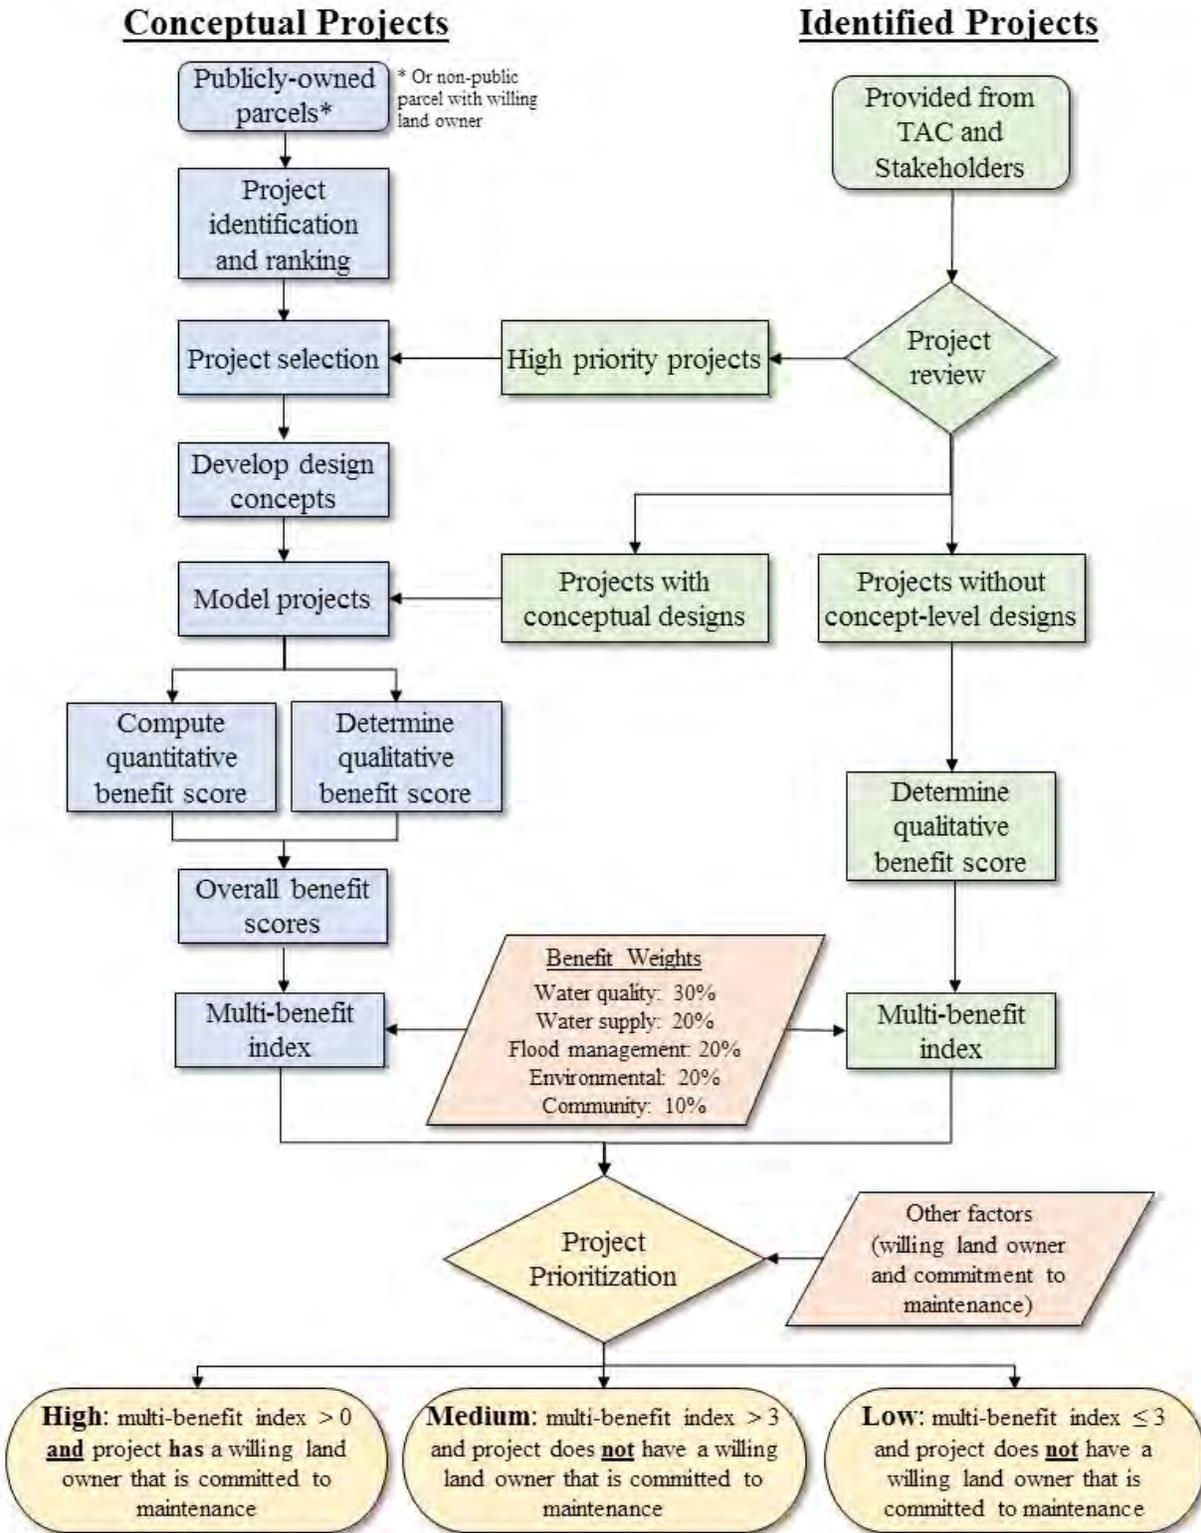

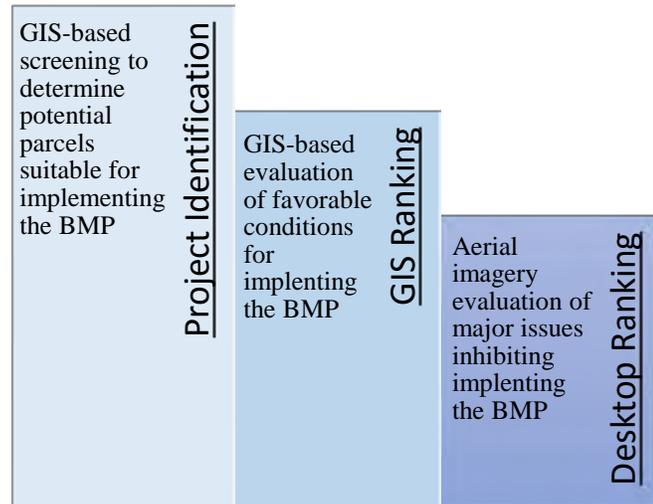

Figure 11. Identification and Prioritization of Projects Flowchart

## 4.1 Project Identification and Ranking

Identification and ranking of potential parcels for conceptual project implementation was performed as a three-step process involving: 1) project identification, 2) project condition evaluation (Phase I. GIS-based ranking), and 3) the drainage area and general feasibility evaluation (Phase II. Desktop Ranking) (see Figure 12 and Appendix E for a detailed explanation). BMP types considered for SWRP project implementation include green streets, direct use storage tanks, and natural treatment systems which may be either infiltration-based or treatment-based BMPs.

**Figure 12. Three step project identification and ranking process**

### 4.1.1 GIS-Based Parcel Screening and Initial Feasibility Screening

A GIS-based screening process was first executed on parcels within the SWRP planning area to determine potential parcels suitable for BMP implementation. As part of this screening process, suitable parcels for BMP implementation were defined as large, undeveloped, publicly-owned parcels (or non-public parcels with willing land owners<sup>24</sup>) located adjacent to storm drains or channels, downgradient of large urban areas, and free of certain constraints associated with implementation of BMPs. Areas exhibiting these constraints (e.g., areas with slopes greater than 10% or areas occupied buildings) were removed from consideration, since these constraints, which were based on BMP siting guidance from the Ventura County Technical Guidance Manual (Geosyntec Consultants and Larry Walker Associates, 2011), could inhibit or severely limit the feasibility of implementing certain BMPs.

While many of the implementation constraints are consistent across BMP type, some are BMP-specific. Therefore, parcels were subject to three different series of BMP-specific screening processes that were related to the three BMP types investigated (i.e., parcels were evaluated using a different set of constraints when determining if natural treatment systems were suitable as compared with direct use BMPs). Listed below are the thirteen BMP screening criteria metrics from which subsets were applied for the BMP-specific screening processes. Appendix E contains

<sup>24</sup> For projects proposed on privately owned land, if they are to move forward with planning and design, the City will coordinate with the landowners to secure agreements to allow for BMP construction and operation/maintenance.

details regarding the overall project identification process and the constraints that were applied for each BMP type.

- Lakes/reservoirs: eliminated areas within 300 ft of lakes and reservoirs
- Vernal Pools: eliminated areas designated as vernal pool
- Water wells: eliminated areas within 100 ft of production wells
- Contaminated groundwater: eliminated areas with contaminated groundwater or soil by removing areas within 100 ft of active cleanup sites registered on GeoTracker
- Environmentally sensitive areas: eliminated areas designated as critical habitats
- Floodplain: eliminated areas within 100-yr floodplain
- Slope: eliminated areas with an average slope of greater than 10%
- Buildings and structures: eliminated areas within 10 ft of footprint
- Groundwater liquefaction: eliminated areas designated “high severity” for groundwater liquefaction
- Size: eliminated continuous areas less than 0.25 acres (or less than 150 ft long for green streets)
- Road type: eliminated roads classified as highways or freeways (green streets only)
- Storm drains and channels: eliminated usable areas that were located more than 500 ft from a water source<sup>25</sup>
- Near a potential use parcel: eliminated usable areas that were located more than 500 ft from a potential use parcel (applicable to direct use only)

Priority was given to infiltration-based BMPs for their relatively greater cost-effective water quality and water supply benefits. For areas where infiltration-based BMPs were not feasible, direct use or natural treatment-based BMPs were also considered. Table 9 shows the number of potential BMP projects determined through the project identification process, by BMP type.

**Table 9. Summary of Project Screening Results**

<b>Number of SWRP Potential Projects Identified</b>			
<b>Natural Treatment System</b>	<b>Green Street</b>	<b>Direct Use</b>	<b>Total Projects</b>
1,125	3,926	638	5,689

<sup>25</sup> It should be noted, for all project types, that if a storm drain or channel has ever been classified as a blue line channel, the project may be subject to different permitting requirements that may result in additional costs and implementation time.

#### **4.1.2 Project condition evaluation (Phase I. GIS-based Ranking)**

After the identification of potentially feasible projects (based on automated GIS constraints screening), potential projects were compared to one another and ranked to best allocate future resources to projects that are realistic and effective. Spatial GIS files, some of which were utilized in the project identification process, were used in the Phase I ranking process to prioritize areas with more favorable conditions for BMP implementation. Numerical scores from 0 to 3 were assigned to represent level of favorability related to the given parameters where applicable, which are listed below.

- Imperviousness
- Slope
- Ownership (i.e., public or private)
- On-site septic system
- Soil infiltration (hydrologic soil group)
- Distance from planned subdivision
- Distance from storm drain source
- Size of storm drain source
- Street Type
- Size/Length of Usable Area

Scores representing favorability for the parameters listed above were then weighted based on priority to determine an overall weighted Phase I ranking score for each potential project (see Attachment E-1).

#### **4.1.3 Drainage area delineation and desktop feasibility evaluation (Phase II. Desktop Ranking)**

Phase II of the ranking process involved a manual desktop-level analysis of projects by stormwater BMP-knowledgeable practitioners, with the main objective to examine each parcel using aerial imagery in GIS software to identify any major issues that could inhibit BMP implementation and benefit opportunities. The City and stakeholders also identified feasible projects based on local knowledge, which had been eliminated from consideration or had not been identified during the initial project identification and ranking. Only the top ranked Phase I projects and City or stakeholder identified projects were examined for Phase II ranking (see Attachment E-2), however any potential project location may be evaluated using the Phase II methodology and added to the ranking list in the included Phase II Ranking Microsoft Excel file.

Similar to the Phase I ranking, the following parameters were examined for each project and assigned a ranking score from 0 to 3 based on favorability:

- Approximate size of drainage area and percentage of the drainage area that is urban

- LPR Model Catchment Prioritization Index (CPI)<sup>26</sup>
- Trash priority land use in drainage area
- Project benefits economically disadvantaged area<sup>27</sup>
- BMP implementability<sup>28</sup>

Each Phase II metric was also weighted based on priority to determine the overall Phase II ranking scores. The projects with the highest Phase II ranking scores were deemed to be the most favorable projects for BMP implementation.

Additional details related to project identification and ranking are included in Appendix E. The list of all identified potential BMP implementation projects and their Phase I ranking score, and where applicable, the Phase II ranking conducted for top ranked projects, are included in Appendix E and in the Phase II Ranking Microsoft Excel file and two KMZ<sup>29</sup>.

## 4.2 Conceptual Project Design

The conceptual design process is two-step approach which begins by determining the drainage area to the proposed project and then selecting the appropriate design attributes based on general project design guidance. The conceptual project drainage area is delineated using waterbody and storm drain spatial files and elevation data from Google Earth and a digital elevation model (DEM). The stormwater quality design volume (SQDV) is then determined for the project using the Urban Runoff Quality Management approach, as outlined in the CASQA BMP Handbook (CASQA, 2003). This method, which estimates the maximized stormwater quality captured volume based on translating rainfall to runoff using regression equations, approximately corresponds to the 85<sup>th</sup> percentile runoff event.

The conceptual project is sized to provide storage capacity for the SQDV or maximize<sup>30</sup> the usable area of the parcel in order to capture and infiltrate, treat, or reuse the largest amount of stormwater

---

<sup>26</sup> A multi-pollutant score that reflects the relative magnitude of stormwater pollutant loads in the catchment area (weighted based on pollutant priorities).

<sup>27</sup> Based on U.S. Department of Housing and Urban Development (HUD) and U.S. Economic Development Administration (EDA) qualified census tracts and block groups

<sup>28</sup> Issues examined for BMP implementability include large trees/vegetation in usable area, high amount of impervious surface (i.e., parking lots or large structures), presence of powerlines/utilities, difficult or nonexistent path for transporting water from the source to the parcel, and configuration of usable area.

<sup>29</sup> Available for download at the City Stormwater Management website: [www.cityofredding.org/departments/public-works/environmental-management/storm-water-management](http://www.cityofredding.org/departments/public-works/environmental-management/storm-water-management)

<sup>30</sup> It should be noted that maximizing the usable area on the parcel is not always adequate for providing storage capacity for the entire SQDV. The usable area is maximized if there was not adequate space to provide storage for the SQDV or if there is adequate space for the SQDV and it was cost effective to expand the footprint and provide storage capacity larger than the SQDV (i.e., there were no site limitations, even minor constraints such as moderate vegetation/trees, moderate slopes, paved areas, or other existing site uses). This is explained further in Appendix F.

and dry weather runoff (based on visual assessment of site specific constraints and existing infrastructure). General design parameters for each project type (and the process for determining them), include depths, storage capacity, side slopes, etc., are based on guidance from the Ventura County Technical Guidance Manual, City-provided green street design documents, and site-specific conditions<sup>31</sup>. The process for determining conceptual project drainage areas, the SQDV, and design parameters for each project type is outlined in detail in Appendix F.

The City, TAC, and stakeholders screened the list of potential projects for BMP implementation based on local knowledge of potential obstacles, and selected projects for the development of BMP design concepts. Appendix G describes project concept development (following the approach above) for the current SWRP conceptual projects<sup>32</sup> and includes a map showing the locations of each project and drainage area relative to water quality priorities and the City's storm drain network. Additionally, detailed cut sheets for some of the conceptual projects, which contain a description of the project, design parameters, an example schematic, map, and modeling results (to be discussed), are included in Appendix B.

### **4.3 Quantitative Analysis of Project Benefits**

The SWRP Guidelines provide guidance (Section VI.C.2) on appropriate quantitative methods for project identification and prioritization, and the following models were evaluated for potential use in modeling projects for the SWRP: the LPR Model, the Structural BMP Prioritization and Analysis Tool (SBPAT), the EPA Storm Water Management Model (SWMM), and the Stormwater Tool to Estimate Load Reduction. These models were evaluated based on availability of required input data, cost-effectiveness, ease of use, functionality and accuracy relative to the SWRP Guidelines, and ability for the City to consistently evaluate new projects after completion of the SWRP.

Appendix F presents an overview of the four evaluated models, in addition to a list of all SWRP modeling requirements and whether each of the four models meets the given requirements. Based on the assessment of the four modeling approaches, the LPR Model was selected as the most suitable and cost-effective option for use in the SWRP to meet the modeling requirements of the SWRP Guidelines. Additional details on the modeling methodology evaluation is included in Appendix F.

The LPR Model is used to quantify water quality, water supply, and flood management benefits associated with each conceptual project. The basic modeling approach is as follows (and is described in detail in Appendix F and the LPR Model Technical Report [Geosyntec Consultants, 2017]):

---

<sup>31</sup> The site is investigated, using aerial imagery, for constraints that would limit the feasibility of BMP implementation, such as heavy vegetation/trees, high slopes, utilities, buildings, existing uses such as sports fields, etc.

<sup>32</sup> Appendix G is designed to be updated to include the design details as projects are added to the SWRP.

1. determine drainage area for the proposed project (also used for conceptual design);
2. compile spatial data in GIS to determine necessary modeling inputs for the project drainage area, including land use and size of the drainage area;
3. combine runoff coefficients (determined by drainage area characteristics) with historical meteorological data to estimate average annual stormwater runoff volumes<sup>33</sup> generated in the project drainage area (using the Rational Method);
4. combine land use-specific baseline runoff volumes with land use pollutant-specific event mean concentrations (EMCs) to calculate average annual baseline pollutant loads;
5. use conceptual design parameters for the project with nomographs describing the relationship between expected performance, size (relative to influent runoff volume), and drawdown time of BMP in order to determine the percent of the total average annual runoff volume draining to the project that the project is capable of treating/managing (percent capture);
6. use the percent capture values and expected performance of structural BMPs, based on data from the International Stormwater BMP Database (<http://www.bmpdatabase.org/>), to determine the quantity of runoff volume and pollutant load captured (and infiltrated or treated) by the project during an average annual year, resulting in an estimation of the average annual pollutant load reduced, water supply augmentation volume, and runoff volume controlled by the project.

The modeling assumptions and complete results for the anticipated reductions in pollutant loads, water supply augmentation volume, and runoff volume controlled by the current SWRP conceptual projects are presented in Appendix G.

#### **4.4 Multiple Benefits Prioritization**

As required by California Water Code Section 10562(e) and the SWRP Guidelines (Section VI.C), the SWRP must use “measurable factors to identify, quantify and prioritize potential stormwater and dry weather runoff capture projects.” Projects are prioritized based on their potential to be implemented and maintained (i.e., with a committed landowner and operation and maintenance capabilities) and their potential to achieve multiple benefits in the five benefit categories identified by the SWRP Guidelines. This approach for multiple benefit quantification and prioritization was developed to fulfill requirements in the Water Code and SWRP Guidelines, and the methodology will serve as a useful tool for evaluating multiple benefits of projects. The purpose of the prioritization is not to rank the projects with respect to each other, but to simply identify those projects that will achieve multiple benefits and are likely to be constructed and maintained, which would therefore qualify them for funding.

---

<sup>33</sup> Dry weather water quality benefits may also be expected but are not estimated here.

Benefit categories include water quality, water supply, flood management, environmental, and community benefits. The SWRP Guidelines identify main benefits in each benefit category and additional benefits to inform project selection and design, as shown in Table 10. Projects implemented in accordance with the SWRP are required to address at least two main benefits and as many additional benefits as feasible for each project. Projects that achieve multiple benefits support a watershed-based approach to treating stormwater and dry weather runoff as a resource rather than an environmental nuisance or flood hazard.

**Table 10. Stormwater Management Benefits (Table 4 in the SWRP Guidelines)**

Benefit Category	Main Benefit	Additional Benefit
Water Quality	<ul style="list-style-type: none"> <li>Increased infiltration and/or treatment of runoff</li> </ul>	<ul style="list-style-type: none"> <li>Nonpoint source pollution control</li> <li>Reestablished natural water drainage and treatment</li> </ul>
Water Supply	<ul style="list-style-type: none"> <li>Water supply reliability</li> <li>Conjunctive use</li> </ul>	<ul style="list-style-type: none"> <li>Water conservation</li> </ul>
Flood Management	<ul style="list-style-type: none"> <li>Decreased flood risk by reducing runoff rate and/or volume</li> </ul>	<ul style="list-style-type: none"> <li>Reduced sanitary sewer overflows</li> </ul>
Environmental	<ul style="list-style-type: none"> <li>Environmental and habitat protection</li> <li>Increased urban green space</li> </ul>	<ul style="list-style-type: none"> <li>Reduced energy use, greenhouse gas emissions, or provides a carbon sink</li> <li>Reestablishment of natural hydrograph</li> <li>Water temperature improvements</li> </ul>
Community	<ul style="list-style-type: none"> <li>Employment opportunities provided</li> <li>Public education</li> </ul>	<ul style="list-style-type: none"> <li>Enhance and/or create recreational and public use areas</li> </ul>

The approach for assessing multiple benefits consists of two parts: scoring of multiple benefits to determine a multi-benefit index for each project; and prioritization of all projects based on the multi-benefit index and other factors.

The approach for scoring a multi-benefit index for projects in the SWRP differs slightly for those projects with conceptual designs and/or a preliminary benefit quantification (i.e., conceptual projects) and other identified projects that have not been developed into concept-level designs and modeled (i.e., non-modeled projects). For conceptual projects, available design and stormwater treatment modeling results are used to determine quantitative metrics for the benefit categories outlined in the SWRP, and these are combined with qualitative assessments of each project’s benefits to determine a multi-benefit index. For non-modeled projects, a modified multiple benefit approach is used that is based solely on qualitative assessments of each project’s ability to achieve multi-benefits, as the details needed to quantify all benefits have not yet been developed.

For both types of projects, each benefit category is assigned a weight, according to its relative importance to the City, in order to determine an overall multi-benefit index. This approach is based in concept on the original Los Angeles Countywide BMP Prioritization Methodology ([www.LABMPmethod.org](http://www.LABMPmethod.org)) and has been applied in multiple watershed management plans and

SWRPs statewide. The detailed methodology for the multi-benefit index scoring is included in Appendix F.

After multi-benefit indices are determined, projects are prioritized (Water Code 10562(b)(2) and SWRP Guidelines Section VI.D) based on their multi-benefit indices and other factors related to feasibility of implementation and commitment to maintenance as shown below:

- **High:** multi-benefit index greater than zero and the project has a willing land owner that is also committed to performing necessary maintenance
- **Medium:** multi-benefit index greater than three, but the project does not have (or it is undetermined) a willing land owner also committed to maintenance
- **Low:** multi-benefit index less than or equal to three and the project does not have (or it is undetermined) a willing land owner also committed to maintenance

All results relating to evaluation of multiple benefits and prioritization of current conceptual projects are presented in Appendix G, including qualitative and quantitative scores for each benefit category, overall benefit category scores (combining qualitative and quantitative scores), benefit weights, multi-benefit indices, and prioritization designations, both for conceptual projects and non-modeled projects (as applicable).

## 5 IMPLEMENTATION STRATEGY AND SCHEDULE

To encourage the long-term implementation and overall success of the SWRP, a prescriptive yet flexible implementation strategy is needed. This section discusses strategies for implementation of the SWRP, including:

- specific actions for implementing the SWRP
- identification of available and potential resources and funding,
- a schedule for major implementation activities,
- a plan for ongoing TAC and community participation,
- an adaptive management framework that utilizes a decision support tool, and
- tracking and evaluation of performance measures.

The strategies described herein fulfill the requirements in Section VI.E in the SWRP Guidelines which covers regulations under Water Code (See Sidebar).

### 5.1 Specific Actions for Implementation

The SWRP is structured as a living document and implemented as an ongoing, adaptive program. The City will be responsible for maintaining and updating the SWRP as needed, in coordination with updates to the IRWMP, and at intervals that are aligned with stormwater regulatory requirements, grant program solicitations, and community interests. When changes to the SWRP are necessary, the City will officially propose those changes to the Northern Sacramento Valley IRWM Group and provide a revised final SWRP and a draft showing the changes for record keeping purposes. No agency will be able to modify the SWRP without the City's approval.

To ensure an effective implementation of the SWRP the City will implement the following specific actions as funding is available and the need arises:

- Perform desktop ranking of potential project locations when new projects are recommended (see Appendix E)
- Conceptually design, quantify the multiple benefits, and prioritize new stormwater projects selected for inclusion in the SWRP (see Appendix F)
- Regularly review and revise the status (e.g, potential project, conceptual project, feasible project, implemented project, etc.) of projects listed in the Prioritization Tool (see Section 5.5 below)

### Relevant California Water Code Requirements

- Section 10562(d)(8) requires that the SWRP identifies projects, programs, and decision support tools to ensure the effective implementation of the SWRP,
- Section 10562(b)(7) requires that the SWRP is submitted, upon development, to the applicable IRWM group for incorporation into the IRWM plan.

Furthermore, as SWRP projects are implemented and information is gathered over time, the SWRP should be modified to reflect the most current understanding of the watershed and present a sound approach to addressing changing conditions. Future changes to the SWRP may include:

- Revising multi-benefit scores based on changing water quality priorities in the relevant watersheds according to new TMDLs or 303(d) listings.
- Updating the metrics-based, quantitative analysis of potential project benefits based on new BMP performance data, new local water quality monitoring data, water quality priorities, or modifications to the project designs.

## **5.2 Resources for Implementation**

The SWRP will be submitted to the Northern Sacramento Valley IRWM Group<sup>34</sup> for incorporation into the IRWMP. Administration and implementation of the SWRP will be provide by the City, including activities such as inclusion of additional projects, engagement with stakeholders, and general plan updates as needed. For implementation of specific projects identified in the SWRP (design and construction), the City, in addition to any agency (or agencies) partnering in development of the project, will coordinate resources and funding necessary for the successful administration, implementation, and maintenance of the project. This includes activities such as project scoping, developing grant proposals, acquiring funding, and implementation of the projects, which are under the responsibility of the City. Funding possibilities for project implementation may combine a variety of sources including but not limited to capital improvement plan funds, general funds, and local, state, federal, or private grant and bond funds. Financing for project implementation will be developed in the future as project designs are developed and availability of funding sources are assessed.

## **5.3 Implementation Schedule**

Table 11 shows the schedule for activities and milestones relating to the SWGP and a proposed schedule for activities specific to the SWRP. The proposed schedule includes incorporation of the SWRP into the existing IRWMP.

---

<sup>34</sup> The Northern Sacramento Valley IRWM Group involves multiple agencies, stakeholders, tribes, individuals and groups to address water-related issues and offer solutions which can provide multiple benefits to the region. Since April 2014, a board of directors and technical advisory committee have led the implementation of the IRWMP. The board of directors meet on the first Monday of the months of March, June, September and December and consists of three appointments made by each of the six Boards of Supervisors in Butte, Colusa, Glenn, Shasta, Sutter and Tehama Counties, for a total of eighteen members. The TAC meets on the third Wednesday of each month (or as needed) and consists of a staff contact for each County and a landowner representative. Additional details about the IRWM Group can be found at <http://nsvwaterplan.org/>

**Table 11. SWRP Schedule**

Milestone	Date
<b>State SWGP Activities</b>	
Water Quality, Supply, and Infrastructure Improvement Act (Proposition 1) approved	November 4, 2014
Prop 1 SWGP final planning grant funding list (Round 1)	May 2016
Prop 1 SWGP implementation grant solicitation period closes (Round 1)	July 8, 2016
Prop 1 SWGP final implementation grant funding list (Round 1)	October 2016
Prop 1 SWGP implementation grant solicitation application period (Round 2)	2019
<b>Redding Stormwater Program Activities</b>	
Final Draft of the SWRP	June 30, 2018
Approval of SWRP by the City Council	Fall 2018
Submit SWRP for incorporation into the IRWMP	Fall 2018
Submittal of the SWRP to the State Water Resources Control Board	July 31, 2018
Prop 1 Implementation Grant Applications	2019
Incorporate additional eligible multi-benefit stormwater projects into the SWRP from future TMDL Wasteload Allocation Attainment Plan and other efforts	Ongoing
Investigate additional funding options	
Evaluation of SWRP performance measures	
Pursuit of other funding options	Project-specific and TBD based on funding availability and other implementation constraints
Planning for projects	
Permitting for projects	
Design of projects	
Construction of projects	

#### **5.4 Ongoing Collaboration**

The following programs have been identified to assist the City in effective implementation of strategies and projects identified in the SWRP:

- **TAC E-mail group:** Updates related to the SWRP will be sent to the TAC by e-mail as needed. Emails will also be sent out to remind all parties of upcoming deliverables (e.g., implementation funding deadlines) and to encourage ongoing collaboration regarding project identification and planning.
- **TAC Meetings:** Meetings with the TAC will be held, as needed, to discuss more significant items relating to the SWRP implementation or modification.

Community outreach will continue during the SWRP administration and project implementation, in order to encourage community members to identify and propose additional projects for inclusion in the SRWP and to be involved in the projects that affect them. While each project will have slightly different milestones, the following actions will be taken throughout the City regarding the SWRP administration:

- Stakeholders will receive email notifications of significant updates to the SWRP.

- Information will be distributed on the City website ([www.cityofredding.org/departments/public-works/environmental-management/storm-water-management](http://www.cityofredding.org/departments/public-works/environmental-management/storm-water-management)). The website will provide information on significant updates and milestones and will be easily accessible to the public.

The City will carry out project implementation in accordance with local regulations and public process requirements, allowing the community the opportunity to engage and contribute to the project through the project life, including during planning, permitting, design, and construction phases. Examples of other community outreach strategies that may be used include the following:

- Engagement with and presentations to interested stakeholder groups and other community groups.
- Public outreach related to contracting processes for project design, construction, and grant applications/acceptance (if applicable), and as required by the California Environmental Quality Act (CEQA).
- Outreach within project construction area and its vicinity prior to initiation of project construction activities.
- Post-construction outreach including ribbon cutting ceremonies, educational signage, project presentations and demonstrations at schools, for community groups and for other interested groups and organizations.

SWRP projects will provide an opportunity to showcase the many benefits of green infrastructure, particularly regarding stormwater capture, reduced local flooding, urban greening, and other features and functionality that will serve the community. With proper educational tools such as interpretive signage, the public can also gain a better understanding of how the project provides opportunities to capture, treat, and conserve water. As a result, constructed projects will provide a mechanism for community participation and education that could help garner support for additional projects implemented over time.

## 5.5 Adaptive Management Tools

In order to allow the City and other local stakeholders to add new projects to the SWRP, the Prioritization Tool was created. This intuitive adaptive decision support tool allows the City to:

- collect and store key project information and quantified benefits for new projects with all projects currently included in the SWRP; and
- prioritize new projects relative to all projects currently included in the SWRP.

The Prioritization Tool, a Microsoft Excel file, can be downloaded from the City's website ([www.cityofredding.org/departments/public-works/environmental-management/storm-water-management](http://www.cityofredding.org/departments/public-works/environmental-management/storm-water-management)), along with directions for entering new projects and submitting the populated tool to City. The Prioritization Tool contains an interface tab that project proponents will use to enter their project information, such as the project name, project type, brief description, project location

and responsible jurisdiction, and quantified benefits. After the user submits their project's information, the project data is stored within the Prioritization Tool.

The Prioritization Tool stores information for record keeping purposes and also automatically calculates the quantitative and qualitative benefit scores, overall benefit scores for each benefit category, and the multi-benefit indices, as described in Section 4.4, based on the input data provided. New projects are automatically prioritized into the appropriate “high”, “medium”, or “low” designation based on the calculated multi-benefit index and other information provided (i.e., if there is a willing land owner committed to performing maintenance). Based on the methodology used to calculate the benefit scores in the SWRP (outlined in Section 4.4), it is possible that scores and the multi-benefit index for all projects will change based on a newly entered project. However, the Prioritization Tool automatically updates for all entered projects as needed. The Prioritization Tool also stores the status of each project and can easily be modified as the project moves from an idea to implemented.

## **5.6 Implementation Performance Measures**

The modeling performed for each project concept, using the LPR Model, determines the expected outcomes or benefits of each proposed project. These outcomes include water quality and water supply augmentation benefits, in addition to the other benefit categories of flood management, community, and environmental benefits. For example, the SWRP estimates expected outcomes for each proposed project related to the volume of water supply that may be provided or the load of a pollutant that may be prevented from reaching the receiving water.

Relevant ongoing monitoring programs conducted in the SWRP area are outlined in Section 3.2.1. The significant monitoring efforts currently being conducted are intended to assess the quality of groundwater used for water supply purposes, surface receiving water quality, and the impacts of MS4 discharges on receiving waters. Ongoing monitoring results will be analyzed as needed to evaluate whether the water quality effects of completed SWRP project can be observed in the receiving waters. If needed, future SWRP implementation may be adjusted based on BMP performance data collected, such that project types with monitoring data showing more effective performance are prioritized. The need for additional project-specific performance evaluation monitoring will be determined during the design phase. Grant funded projects may be expected to implement performance monitoring.

In accordance with recommendations in the SWRP Guidelines (section VI.C.3), the City will continue the current procedures for monitoring data collection and management (as described above). The procedures for the management of additional project-specific performance monitoring data (e.g., planning for how data may be accessed by stakeholders and the public, how existing water quality monitoring will be assessed and maintained, the frequency at which data will be updated, and how data gaps will be identified and addressed) will be specific to each project. GIS data files related to the SWRP, which may be used for updating or adding new projects to the SWRP in the future, will also continue to be managed in the City's geodatabase.

# Storm Water Resource Plan Checklist and Self-Certification

The following should be completed and submitted to the State Water Resources Control Board Division of Financial Assistance in support of a storm water resource plan /functionally equivalent plan. The documents submitted, including this checklist, will be used to determine State Water Board concurrence with the Storm Water Resource Plan Guidelines and statutory water code requirements.

When combining multiple documents to form a functionally equivalent Storm Water Resource Plan, submit a cover letter explaining the approach used to arrive at the functionally equivalent document. The cover letter should explain how the documents work together to address the Storm Water Resource Plan Guidelines.

## WATERSHED IDENTIFICATION (GUIDELINES SECTION VI.A)

<b>Y</b>	3. Plan includes an explanation of why the watershed(s) and sub-watershed(s) are appropriate for storm water management with a multiple-benefit watershed approach;
<u>References:</u> City of Redding Stormwater Resource Plan section 3.2 (pgs. 12-13)	
<b>Y</b>	4. Plan describes the internal boundaries within the watershed (boundaries of municipalities; service areas of individual water, wastewater, and land use agencies, including those not involved in the Plan; groundwater basin boundaries, etc.; preferably provided in a geographic information system shape file);
<u>References:</u> City of Redding Stormwater Resource Plan section 3.2 (pgs. 16-17) and Figure 6 (pg. 17)	
<b>Y</b>	5. Plan describes the water quality priorities within the watershed based on, at a minimum, applicable TMDLs and consideration of water body-pollutant combinations listed on the State's Clean Water Act Section 303(d) list of water quality limited segments (a.k.a impaired waters list);
<u>References:</u> City of Redding Stormwater Resource Plan section 3.2.1 (pgs. 22-27), Table 6 (pg. 25), Table 7 (pg. 26), and Figure 10 (pg. 27)	
<b>Y</b>	6. Plan describes the general quality and identification of surface and ground water resources within the watershed (preferably provided in a geographic information system shape file);
<u>References:</u> City of Redding Stormwater Resource Plan section 3.2 (pgs. 16-17) and Figure 6 (pg. 17)	
<b>Y</b>	7. Plan describes the local entity or entities that provide potable water supplies and the estimated volume of potable water provided by the water suppliers;
<u>References:</u> City of Redding Stormwater Resource Plan section 3.2 (pgs. 16-17) and Figure 6 (pg. 17)	
<b>Y</b>	8. Plan includes map(s) showing location of native habitats, creeks, lakes, rivers, parks, and other natural or open space within the sub-watershed boundaries; and
<u>References:</u> City of Redding Stormwater Resource Plan section 3.2 (pgs. 18-121), Table 7 (pg. 26), Figure 8 (pg. 20), Figure 9 (pg. 21), and Figure 10 (pg. 27)	
<b>Y</b>	9. Plan identifies (quantitative, if possible) the natural watershed processes that occur within the sub-watershed and a description of how those natural watershed processes have been disrupted within the sub-watershed (e.g., high levels of imperviousness convert the watershed processes of infiltration and interflow to surface runoff increasing runoff volumes; development commonly covers natural surfaces and often introduces non-native vegetation, preventing the natural supply of sediment from reaching receiving waters).
<u>References:</u> City of Redding Stormwater Resource Plan section 3.2 (pgs. 18-121), Table 7 (pg. 26), Figure 8 (pg. 20), and Figure 9 (pg. 21)	

**WATER QUALITY COMPLIANCE  
(GUIDELINES SECTION V)**

<b>Y</b>	<b>10. Plan identifies activities that generate or contribute to the pollution of storm water or dry weather runoff, or that impair the effective beneficial use of storm water or dry weather runoff.</b>	<b>10562(d)(7)</b>
References: City of Redding Stormwater Resource Plan section 3.2.1 (pgs. 22-23), and Table 3 (pg. 23)		
<b>Y</b>	<b>11. Plan describes how it is consistent with and assists in, compliance with total maximum daily load implementation plans and applicable national pollutant discharge elimination system permits.</b>	<b>10562(b)(5)</b>
References: City of Redding Stormwater Resource Plan section 3.3 (pgs. 28-30) and Table 8 (pg. 30)		
<b>Y</b>	<b>12. Plan identifies applicable permits and describes how it meets all applicable waste discharge permit requirements.</b>	<b>10562(b)(6)</b>
References: City of Redding Stormwater Resource Plan section 3.3 (pgs. 28-30) and Table 8 (pg. 30)		

**ORGANIZATION, COORDINATION, COLLABORATION  
(GUIDELINES SECTION VI.B)**

<b>Y</b>	<b>13. Local agencies and nongovernmental organizations were consulted in Plan development.</b>	<b>10565(a)</b>
References: City of Redding Stormwater Resource Plan section 2 (pgs. 6-9), Table 1 (pg. 7), and Appendix C		
<b>Y</b>	<b>14. Community participation was provided for in Plan development.</b>	<b>10562(b)(4)</b>
References: City of Redding Stormwater Resource Plan section 2 (pgs. 6-9) and Appendix C		
<b>Y</b>	<b>15. Plan includes description of the existing integrated regional water management group(s) implementing an integrated regional water management plan.</b>	
References: City of Redding Stormwater Resource Plan section 5.1 (pg. 43)		

**ORGANIZATION, COORDINATION, COLLABORATION  
(GUIDELINES SECTION VI.B)**

<b>Y</b>	16. Plan includes identification of and coordination with agencies and organizations (including, but not limited to public agencies, nonprofit organizations, and privately owned water utilities) that need to participate and implement their own authorities and mandates in order to address the storm water and dry weather runoff management objectives of the Plan for the targeted watershed.
<u>References:</u> City of Redding Stormwater Resource Plan section 2 (pgs. 6-9), Table 1 (pg. 8), and Appendix C	
<b>Y</b>	17. Plan includes identification of nonprofit organizations working on storm water and dry weather resource planning or management in the watershed.
<u>References:</u> City of Redding Stormwater Resource Plan Appendix C (Table C-1 on page C-1)	
<b>Y</b>	18. Plan includes identification and discussion of public engagement efforts and community participation in Plan development.
<u>References:</u> City of Redding Stormwater Resource Plan section 2 (pgs. 6-9) and Appendix C	
<b>Y</b>	19. Plan includes identification of required decisions that must be made by local, state or federal regulatory agencies for Plan implementation and coordinated watershed-based or regional monitoring and visualization
<u>References:</u> City of Redding Stormwater Resource Plan section 2.1 (pages 6-8), section 5.1 & 2 (pages 43-44), and section 5.5 (pages 47)	
<b>Y</b>	20. Plan describes planning and coordination of existing local governmental agencies, including where necessary new or altered governance structures to support collaboration among two or more lead local agencies responsible for plan implementation.
<u>References:</u> City of Redding Stormwater Resource Plan section 2 (pgs. 6-9)	
<b>Y</b>	21. Plan describes the relationship of the Plan to other existing planning documents, ordinances, and programs established by local agencies.
<u>References:</u> City of Redding Stormwater Resource Plan section 3.1 (pgs. 10-12), Table 2 (pg. 11), Appendix D, Section 3.3 (pgs. 28-30), Table 8 (pg. 30), section 4 (pg. 31)	
<b>Y</b>	22. (If applicable)Plan explains why individual agency participation in various isolated efforts is appropriate.

## QUANTITATIVE METHODS (GUIDELINES SECTION VI.C)

<b>Y</b>	<p><b>23. For all analyses:</b> Plan includes an integrated metrics-based analysis to demonstrate that the Plan's proposed storm water and dry weather capture projects and programs will satisfy the Plan's identified water management objectives and multiple benefits.</p> <p><u>References:</u> City of Redding Stormwater Resource Plan section 4.3 (pgs. 39-40), section 4.4 (pgs. 40-42), Appendix F, and Appendix G</p>
<b>Y</b>	<p><b>24. For water quality project analysis (section VI.C.2.a)</b> Plan includes an analysis of how each project and program complies with or is consistent with an applicable NPDES permit. The analysis should simulate the proposed watershed-based outcomes using modeling, calculations, pollutant mass balances, water volume balances, and/or other methods of analysis. Describes how each project or program will contribute to the preservation, restoration, or enhancement of watershed processes (as described in Guidelines section VI.C.2.a)</p> <p><u>References:</u> City of Redding Stormwater Resource Plan section 3.3 (pgs. 28-30), Table 8 (pg. 30), section 4.3 (pgs. 39-40), section 4.4 (pgs. 40-42), Appendix B, Appendix F, and Appendix G</p>
<b>Y</b>	<p><b>25. For storm water capture and use project analysis (section VI.C.2.b):</b> Plan includes an analysis of how collectively the projects and programs in the watershed will capture and use the proposed amount of storm water and dry weather runoff.</p> <p><u>References:</u> City of Redding Stormwater Resource Plan section 4.2 (pgs. 36-37), section 4.3 (pgs. 38-39), Appendix B, Appendix F, and Appendix G</p>
<b>Y</b>	<p><b>26. For water supply and flood management project analysis (section VI.C.2.c):</b> Plan includes an analysis of how each project and program will maximize and/or augment water supply.</p> <p><u>References:</u> City of Redding Stormwater Resource Plan section 4.2 (pgs. 36-37), section 4.3 (pgs. 38-39), Appendix B, Appendix F, and Appendix G</p>
<b>Y</b>	<p><b>27. For environmental and community benefit analysis (section VI.C.2.d):</b> Plan includes a narrative of how each project and program will benefit the environment and/or community, with some type of quantitative measurement.</p> <p><u>References:</u> City of Redding Stormwater Resource Plan section 4.2 (pgs. 36-37), section 4.3 (pgs. 38-39), Appendix B, Appendix F, and Appendix G</p>
<b>Y</b>	<p><b>28. Data management (section VI.C.3):</b> Plan describes data collection and management, including: a) mechanisms by which data will be managed and stored; b) how data will be accessed by stakeholders and the public; c) how existing water quality and water quality monitoring will be assessed; d) frequency at which data will be updated; and e) how data gaps will be identified.</p> <p><u>References:</u> City of Redding Stormwater Resource Plan section 5.4 (pgs. 45-46) and section 5.5 (pgs. 46-47)</p>

**IDENTIFICATION AND PRIORITIZATION OF PROJECTS  
(GUIDELINES SECTION VI.D)**

<b>Y</b>	<b>29. Plan identifies opportunities to augment local water supply through groundwater recharge or storage for beneficial use of storm water and dry weather runoff.</b>	<b>10562(d)(1)</b>

Soil Type	Hydrologic Soil Group C
Watershed	Churn Creek-Sacramento River
Receiving Water	Boulder Creek
Groundwater Basin	Enterprise

Note: Proposed project is conceptual and subject to change based on future feasibility assessment, funding availability, and/or other information.

**Project Description**

This project plans to revitalize existing infrastructure to allow for water quality treatment, groundwater recharge, and flood management through a series of natural treatment systems, possibly including: infiltration basins, treatment wetlands, bioretention basins, etc. The abandoned sewer ponds are located adjacent to Boulder Creek, which is a salmonid stream and receives significant runoff from areas considered high priority for trash and pollution control. Water will be diverted from Boulder Creek just after it crosses under the I-5 freeway and flow through the treatment system before flowing back into Boulder Creek. The upper basin will be expanded and include a pretreatment area while the lower basin will retain its current footprint. Vegetation, walking paths, and interpretive signage will be incorporated.

**Potential Site Constraints:**

The basin area should be inspected prior to finalizing the project design to confirm no protected species are present. Also necessary ecological instream flows within Boulder Creek along the project location should be confirmed to assist with the design of the project. Numerous permits/agency coordination may be needed to implement the project (RWQCB, CDFW, Army Corps, County Flood Control, Caltrans, etc). A site survey should be conducted to confirm local elevations, infiltration rate, and groundwater elevations.

**Project Design Information**

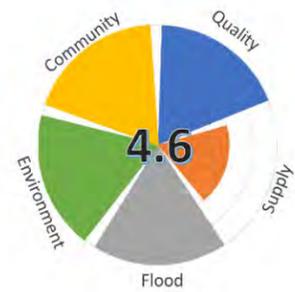

BMP Type	Natural Treatment System
Total Project Footprint	13 acres (includes 3.3 acres pretreatment)
Depth	3-9 ft (includes 1 ft freeboard)
Storage Volume	41 ac-ft
Assumed Infiltration Rate	0.32 in/hr
Stormwater Source	Boulder Creek

Note: Proposed project is conceptual and subject to change based on future feasibility assessment, funding availability, and/or other information.

**Project Benefits**

All benefits are expressed as an average annual estimate based on historical modeling.

**Overall Multi-Benefit Score**  
Highest possible score is a 5

**Water Quality:**  
Pollutant load reductions from drainage area

	Reduced	Remaining
TSS (lbs)	280,000	
NO3 (lbs)	2,100	
Dissolved Cu (lbs)	29	
Fecal Coliform (MPN)	1.2E+14	

0% 25% 50% 75% 100%

**Environmental Enhancements:** Restored vegetation will include native species increasing habitat for animals of interest.

**Flood Management:** 920 acre-feet (38%) of the annual runoff volume and 89% of the volume generated from an 85th percentile 24-hr storm will be captured and slowly released back into Boulder Creek, likely reducing the frequency and intensity of flood events downstream.

**Community Enhancements:** This project is located along the proposed Boulder Creek Trail. Signage to educate the public about the project's multiple benefits, and native vegetation and landscaping will improve the aesthetics of the parcel while providing recreational opportunities.

**Water Supply:** 260 acre-feet will be recharged annually, which is equivalent to the supply for 640 households.

**Volume Capture Analysis**

	85 <sup>th</sup> Percentile, 24-hr Storm	Average Annual
Precipitation (in)	0.91	37.5

### Project Description

This project plans to improve water quality, reduce flows in Linden Ditch, and recharge groundwater by building an offline infiltration system adjacent to the current flow path. Water will be diverted from Linden Ditch approximately where it meets Linden Avenue and directed into the elongated infiltration basin before flowing back into Linden Ditch upstream of West Street. The basin will be located exclusively on city owned parcels and include a pretreatment area. Vegetation, walking paths, and interpretive signage will be incorporated.

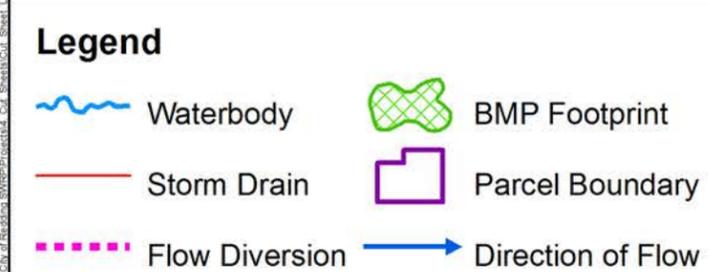

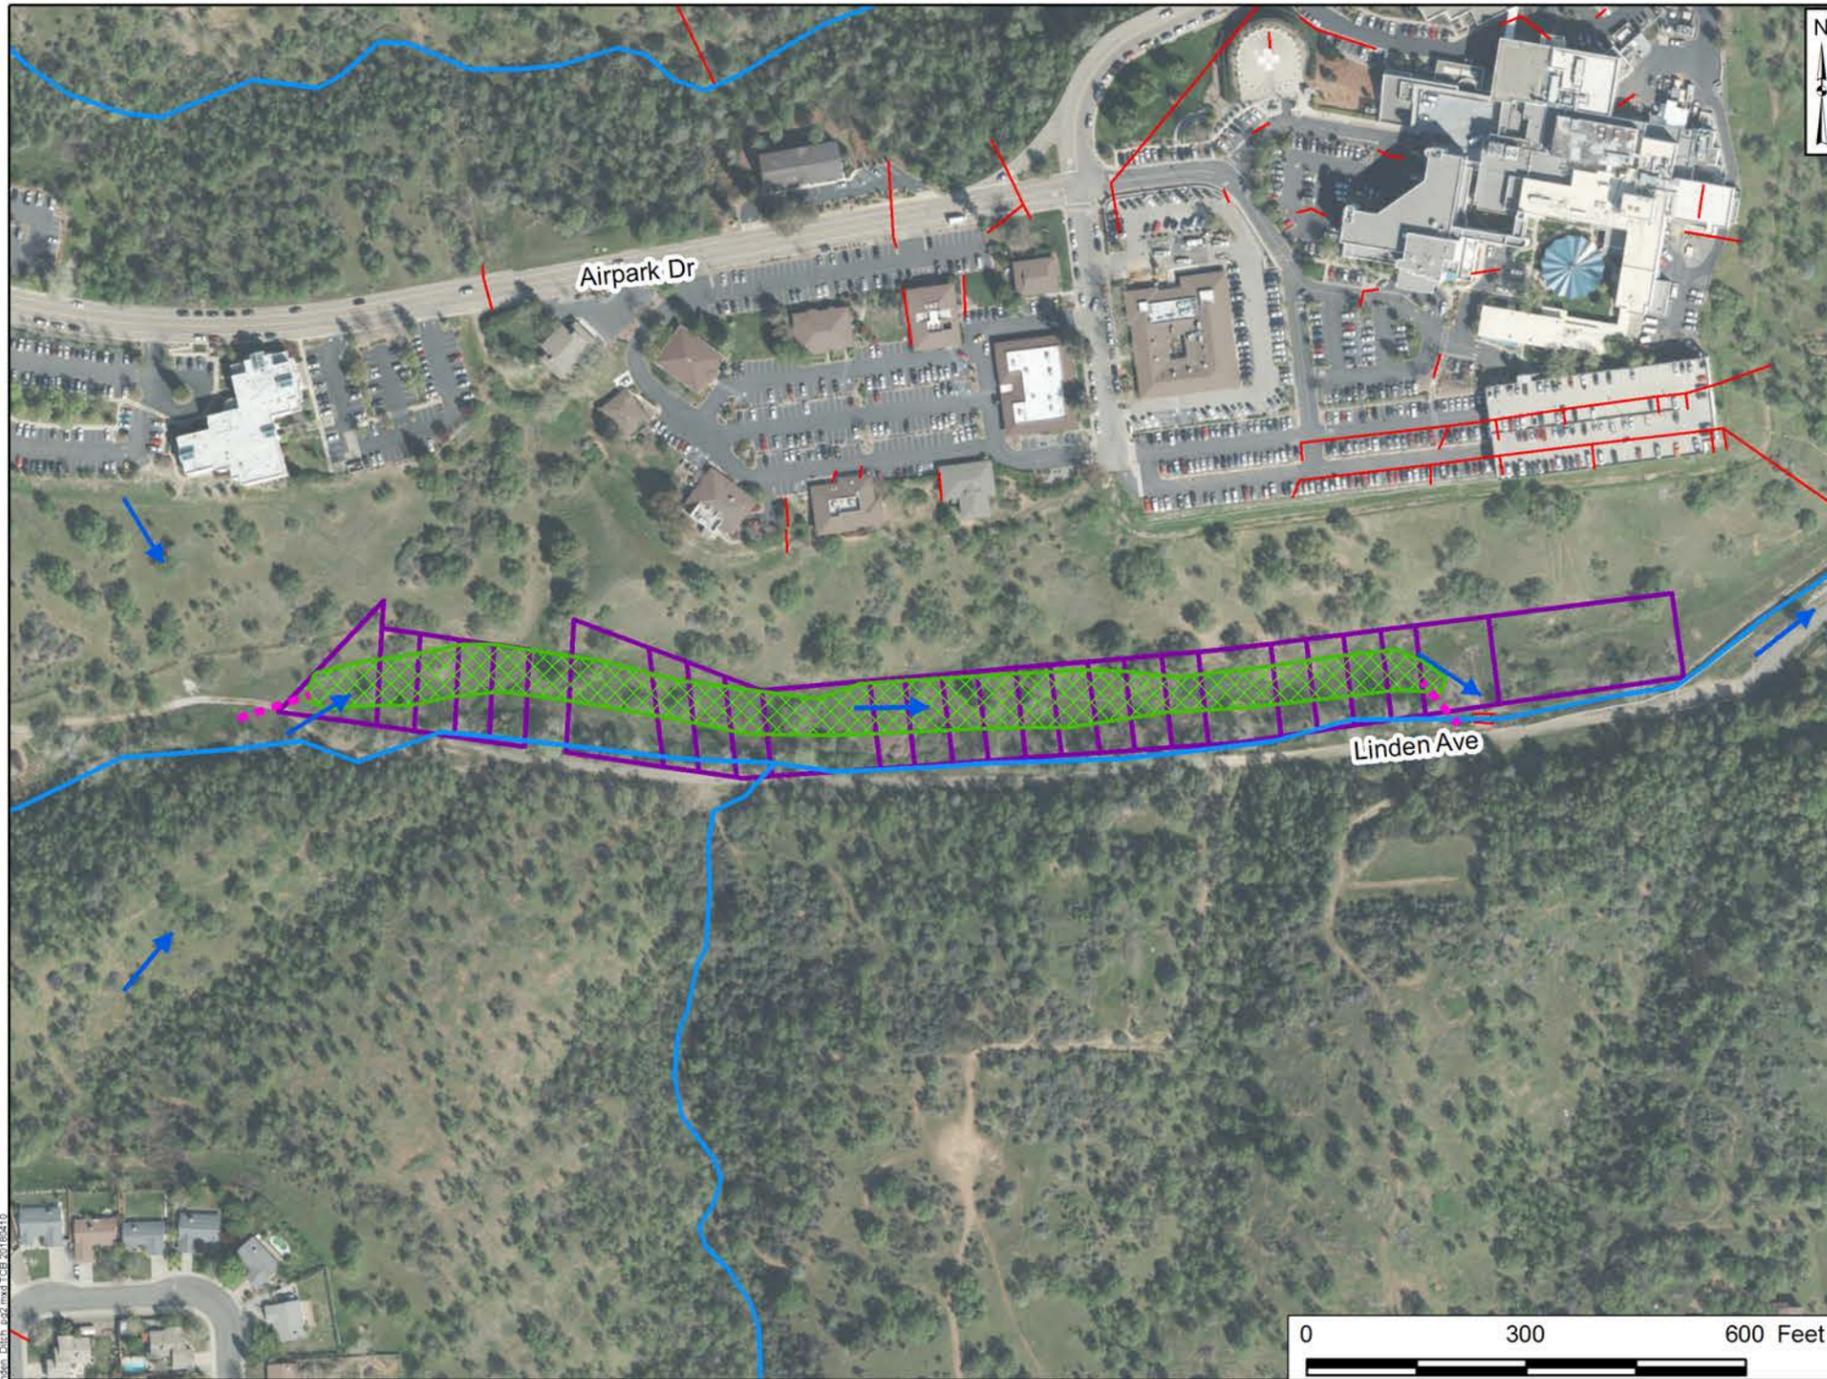

**Potential Site Constraints:**  
 Vegetation and animals in the basin area should be assessed by a qualified biologist prior to finalizing the project design to confirm no protected species are present. Additional permitting may be required for vegetation removal and constructing a diversion from the creek (RWQCB, CDFW, Army Corps, County Flood Control, etc). A site survey should be conducted to confirm local elevations and infiltration rate.

<h2>Linden Ditch Infiltration System Project Concept</h2> <p>City of Redding Stormwater Resource Plan</p>	
	<p>Figure 3</p>
<p>Santa Barbara</p>	<p>April 2018</p>

**Project Design Information**

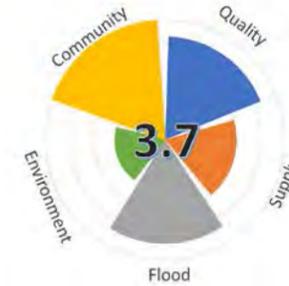

BMP Type	Infiltration System
Total Project Footprint	1.7 acres (includes 0.43 acre pretreatment)
Depth	7 ft (including 1 ft freeboard)
Storage Volume	7.6 ac-ft
Assumed Infiltration Rate	1.5 in/hr
Stormwater Source	Linden Ditch

Note: Proposed project is conceptual and subject to change based on future feasibility assessment, funding availability, and/or other information.

**Project Benefits**

All benefits are expressed as an average annual estimate based on historical long-term modeling.

**Overall Multi-Benefit Score**  
Highest possible score is a 5

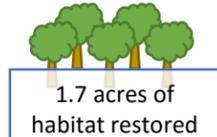

**Water Quality:**

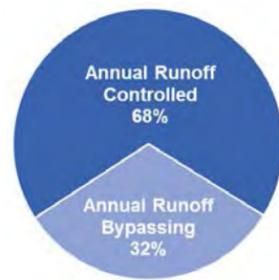

Pollutant load reductions from drainage area

	Reduced	Remaining
TSS (lbs)	77,000	
NO3 (lbs)	440	
Dissolved Cu (lbs)	2.9	
Fecal Coliform (MPN)	9.4E+12	

**Environmental Enhancements:** Infiltrated water will enhance the greenspace and promote nearby vegetation, increasing the habitat value. Existing invasive species will be removed.

**Flood Management:** 170 acre-feet (68%) of the average annual runoff volume will be removed from flowing through the concrete channelized portion of Linden Ditch which runs through the city. All of the volume generated from an 85th percentile 24-hr storm will be captured and infiltrated.

**Community Enhancements:** Signage to educate the public about the project's multiple benefits, and native vegetation and landscaping will improve the aesthetics of the parcel.

**Water Supply:** 110 acre-feet will be recharged annually, which is equivalent to the supply for 270 households.

**Volume Capture Analysis**

	85 <sup>th</sup> Percentile, 24-hr Storm	Long-Term Average Annual

**Project Overview**

Parcel Ownership	City of Redding
APN	204350040000, 204560040000, 204330030000
Soil Type	Hydrologic Soil Group C
Watershed	Churn Creek-Sacramento River
Receiving Water	Jenny Creek
Groundwater Basin	Outside of Anderson

Note: Proposed project is conceptual and subject to change based on future feasibility assessment, funding availability, and/or other information.

### Project Description

This project plans to improve water quality in Mary lake by enhancing the existing wet detention basin above Mary Lake to allow for increased water quality treatment and storage capacity. The enhancements may include reconfiguration of the flow path, increased berm height at the downstream end, sediment removal, and native habitat restoration. Flow into Mary Lake will be controlled by adding an adjustable weir or orifice at the low point of the upper basin. A storage tank is also proposed adjacent to the upper basin to capture peak flows from winter storms for release during the dry months to maintain lake levels and reduce eutrophication. Natural treatment systems will be constructed at the western and eastern sides of Mary Lake to treat additional runoff from the surrounding community. Dredging of Mary Lake will support increased capacity and removal of legacy nutrient-rich sediments.

### Potential Site Constraints:

Vegetation and animals in the basin area should be assessed by a qualified biologist prior to finalizing the project design to confirm whether protected species are present. A site survey should be conducted to confirm local elevations. Additionally, numerous permits may be needed to implement this project (RWQCB, CDFW, Army Corps, County Flood Control, etc).

### Location of Existing Wet Detention Basin

## Mary Lake Lake Restoration Project Concept

### Project Design Information

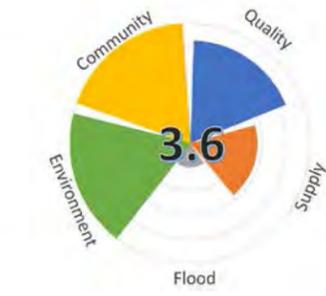

BMP Type	Wet Basin Natural Treatment Systems	Storage Tank
Total Project Footprint	3.6 acres (includes 0.19 acre pretreatment)	0.50 acres
Depth (inc. 1 ft freeboard)	3-5.4 ft	9 ft
Storage Volume	16 ac-ft	4.0 ac-ft
Assumed Infiltration Rate	0.32 in/hr	N/A
Stormwater Source	36 and 24 inch storm drains owned by City	Wet Basin

Note: Proposed project is conceptual and subject to change based on future feasibility assessment, funding availability, and/or other information.

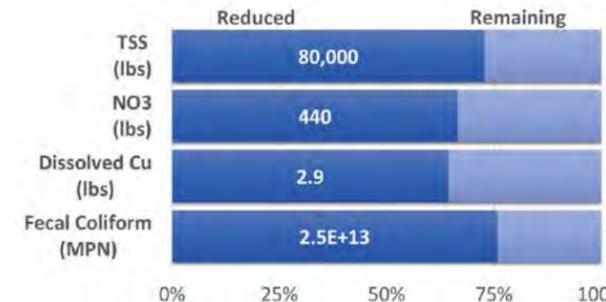

## Project Benefits

All benefits are expressed as an average annual estimate based on historical modeling.

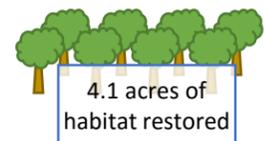

**Overall Multi-Benefit Score**  
Highest possible score is a 5

**Water Quality:**  
Pollutant load reductions from drainage area

**Environmental Enhancements:** Restored vegetation will replace invasive species with native species increasing habitat for animals of interest. Additional water supplied and removal of legacy nutrients will help reduce eutrophication.

**Flood Management:** 190 acre-feet (73%) of the average annual runoff volume and all of the volume generated from an 85th percentile 24-hr storm will be captured and slowly released into Mary Lake before entering Jenny Creek.

**Community Enhancements:** Signage to educate the public about the project's multiple benefits, and native vegetation and landscaping will improve the aesthetics of the parcel.

**Water Supply:** The storage tank and the adjustable weir in the upper wet detention basin are designed to capture and store 8.0 acre-feet for supplying Lake Mary during the summer months, offsetting potable water currently used for this purpose. Additionally, approximately 54 acre-feet will be recharged annually, which may help maintain lake levels through interflow.

## Volume Capture Analysis

	85 <sup>th</sup> Percentile, 24-hr Storm	Long-Term Average Annual
Precipitation (in)	0.91	37.5
Runoff Volume (ac-ft)	6.4	265
<b>Percent of Runoff Volume Captured (%)</b>	<b>100</b>	<b>73</b>
<b>Total Volume Captured (ac-ft)</b>	<b>6.4</b>	<b>190</b>

### Mary Lake Lake Restoration Project Concept

City of Redding  
Stormwater Resource Plan

Santa Barbara

April 2018

Figure  
**6**

### Project Description

This project plans to turn the alley between Market and Pine Street in downtown Redding into a green pedestrian corridor by replacing the existing surface with permeable pavement and rain gardens with an underdrain system. The stormwater will be collected from the busy area near Eureka Way via the existing storm drains and surface runoff. Permeable pavement and rain gardens will reduce the amount of ponding in the alley and provide water quality treatment by allowing the stormwater runoff to percolate into the underdrain system. Community enhancements may also include murals, design of pavers/ground treatments, wayfinding, etc.

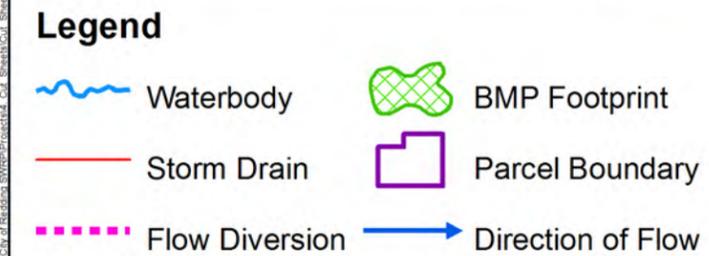

**Potential Site Constraints:**  
 Business owners on either side of the alley should be coordinated with during planning and construction stages since they alley provides access to some parking areas. Percolation testing should be conducted to confirm assumed infiltration rates and a site survey to confirm elevations and evaluate subsurface utilities that may need to be relocated.

### Project Design Information

BMP Type	Green Street
Total Project Footprint	0.16 acres (includes 0.041 acre pretreatment)
Depth	2.3 ft
Storage Volume	0.14 ac-ft
Assumed Infiltration Rate	0.32 in/hr
Stormwater Source	Surface Runoff

Note: Proposed project is conceptual and subject to change based on future feasibility assessment, funding availability, and/or other information.

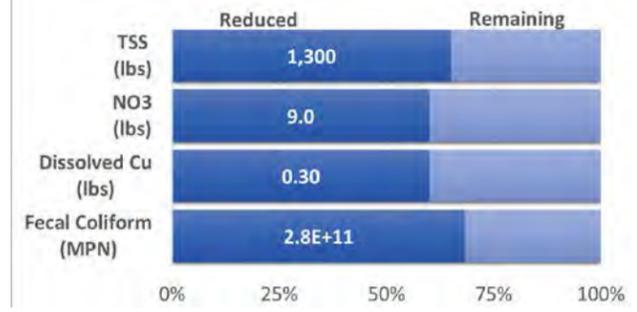

## Project Benefits

All benefits are expressed as an average annual estimate based on historical modeling.

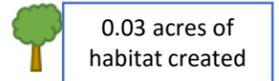

**Overall Multi-Benefit Score**  
Highest possible score is a 5

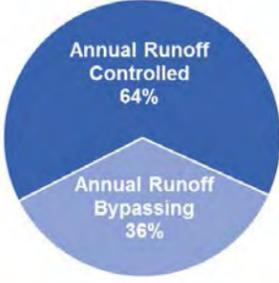

**Water Quality:**  
Pollutant load reductions from drainage area

**Environmental Enhancements:** The urban greening will create opportunities for the planting of native vegetation and habitat for pollinators and other species of interest.

**Flood Management:** 5.6 acre-feet (64%) of the average annual runoff volume will be removed annually from the stormdrain system. About half of the volume generated from an 85th percentile 24-hr storm will be captured and infiltrated.

**Community Enhancements:** Signage to educate the public about the project's multiple benefits, and native vegetation and landscaping will improve the aesthetics of the alley.

**Water Supply:** 2.1 acre-feet will be recharged annually, which is equivalent to the supply for 5 households.

## Volume Capture Analysis

	85 <sup>th</sup> Percentile, 24-hr Storm	Long-Term Average Annual
Precipitation (in)	0.91	37.5
Runoff Volume (ac-ft)	0.21	8.7
<b>Percent of Runoff Volume Captured (%)</b>	<b>48</b>	<b>64</b>
<b>Total Volume Captured (ac-ft)</b>	<b>0.10</b>	<b>5.6</b>

I hereby certify that the Record Searchlight is a newspaper of general circulation within the provisions of the Government Code of the State of California, printed and published in the city of Redding, County of Shasta, State of California; I am the principal clerk of the printer of said newspaper; that the notice of which the annexed clipping is a true printed copy was published in said newspaper on the following dates, to wit:

FILED ON: 01/08/18

PUBLISHED ON:  
01/07/2018, 01/09/2018

A Public Meeting for the City of Redding's Storm Water Resource Plan is set for January 11, 2018, 4:30pm to 6:30pm in the Community Room, 777 Cypress Ave, Redding.

A watershed-based (or sub-watershed based) Storm Water Resource Plan (SWRP) is required as a condition of receiving funding of storm water and dry weather runoff capture projects funded partially or entirely with state funds. The SWRP provides a watershed-based approach to storm water management, seeking to replicate natural hydrology and watershed processes. These watershed-based approaches yield multiple water quality benefits by reducing the volume of runoff delivered to receiving waters, thus reducing the pollutants discharged. Watershed-based approaches to storm water management also yield non-measurable social and community benefits that traditional projects do not provide.

The City of Redding will hold this meeting to receive public input on the preparation of a SWRP. Public input from this meeting will inform the development of the SWRP, and help identify potential projects to augment water supply; protect storm water quality; and provide flood management, environmental, and/or community benefits. For information about this meeting and how to provide public comment, contact Mike Sheffield at [mssheffield@cityofredding.org](mailto:mssheffield@cityofredding.org) or (530)225-4889.

January 7, and 9, 2018

## APPENDICES

Appendix A – Initial Stakeholders (as of November 28, 2017)

## **1 INTRODUCTION**

This Stakeholder Outreach, Education, and Engagement Plan (Outreach Plan) fulfills the purpose of providing an outline of the public engagement and education opportunities associated with the development of the Redding Stormwater Resource Plan (SWRP) through a Proposition 1 State Water Resources Control Board Grant. A Stakeholder is an individual, group, coalition, agency, or other entity that is involved in, affected by, or has an interest in the implementation of the SWRP. This Outreach Plan establishes strategies for effective engagement meeting or exceeding the requirements for consultation of local agencies and nongovernmental organization (NGO) (Water Code Section 10565[a]) and community participation (Water Code Section 10562 [b][4]) in SWRP development and implementation.

## **2 BENEFITS TO STAKEHOLDERS**

The SWRP will be designed to improve stormwater resource management across the City of Redding (City) in order to help water infrastructure systems adapt to climate change, provide priorities for infrastructure construction, and increase regional water self-reliance. This improved management will be accomplished through the identification, benefit quantification, and prioritization of the following types of projects within the SWRP study area: green infrastructure, rainwater and stormwater capture projects, and stormwater treatment facilities. All projects selected will result in a water supply, water quality, flood control, community, and/or environmental benefits to the City, therefore benefitting Stakeholders in reducing demand on stressed water supply, reducing pollutants of concern in water bodies, and/or restoring ecosystems. Stakeholders will be involved during the plan preparation, plan implementation, and project completion.

## **3 ENGAGEMENT IN TECHNICAL AND POLICY ISSUES**

The City will work with a Technical Advisory Committee (TAC) (currently being assembled) to provide education and participation opportunities to engage the public when considering major technical and policy issues related to the development and implementation of the SWRP. Stakeholders provide valuable input into the planning process and inform potential project opportunities. In specific, the roles and responsibilities of the interested Stakeholders are:

1. Provide input into development of the SWRP
2. Attend public meetings
3. Recommend potential locations for project development
4. Provide local knowledge and input regarding conceptual project designs
5. Comment on Draft Sections of the SWRP
6. Provide letters of support for the SWRP and projects

## **4 FACILITATING PUBLIC PARTICIPATION**

The City will conduct broad public education and engagement for the SWRP. Effective public involvement requires establishing trust, developing relationships, and cultivating communication channels between all participating parties. Every meeting is an opportunity to increase transparency and inclusivity as well as build partnership, and in that spirit, the Stakeholder list is always open to new Stakeholders. The Outreach Plan will utilize a variety of communication systems to disseminate information about the SWRP, in part relying on groups that have dedicated memberships and similar concerns and issues as those addressed in the SWRP. Public involvement will be sustained throughout the development of the SWRP with the intention of forming alliances that further the goals and sustainability of the SWRP and projects.

### **4.1 Key Assumptions of the Outreach Plan**

Communication and outreach are two pillars upon which a successful, technically competent and inclusive Integrated SWRP rest. The SWRP development will be based on the following key assumptions.

1. The SWRP process is an open and transparent process and engages all entities in the dialogue on stormwater resource management throughout the City.
2. The SWRP must conform to CA State Water Resource Control Board Storm Water Resource Plan Guidelines.
3. The Public and Interested Stakeholders will review and comment at key times in the SWRP development and implementation.

### **4.2 Stakeholder Identification and Inclusion**

Several key Stakeholders have presented an interest in participating in the SWRP process that represent a variety of interests including local ratepayers, developers, locally regulated commercial and industrial businesses, nongovernmental organizations, nonprofit organizations and the general public. Appendix A provides a list of initial Stakeholder that will be updated as other groups or individuals participate in the SWRP process.

## **5 ENGAGING COMMUNITIES IN PROJECT DESIGN AND IMPLEMENTATION**

Public meetings are an established and effective mechanism to engage communities in planning efforts and projects. The following targeted Stakeholder meetings are designed to engage members of affected communities in project design and implementation.

### **5.1 First Stakeholder Meeting**

During the first Stakeholder meeting, the City in coordination with Geosyntec will present parcel screening, prioritization, and conceptual projects. Stakeholders will be asked for input on proposed project sites, perspectives on benefit priorities, and to identify other potential locations for project

consideration. Stakeholders will also be consulted to incorporate local knowledge of potential implementation conflicts and take Stakeholder specific multiple benefit priorities into account when developing and ranking projects. Prior to this meeting, draft materials will be posted to the internet and distributed through available e-mail lists to provide opportunity for review before the meeting.

### **5.1.1 Agenda for the First Stakeholder Meeting**

1. Project overview
2. Present draft parcel screening and prioritization
3. Request input on additional potential locations/projects for consideration

### **5.2 Second Stakeholder Meeting**

During the second Stakeholder meeting the draft conceptual projects and multiple benefits will be presented. The stakeholders present during this meeting will provide comments and feedback, which may include restructuring the weighting of multiple benefits, re-prioritizing projects based on local benefits, and/or inclusion of necessary components to encourage implementation feasibility and long-term maintenance. The Stakeholders will also be consulted to discuss land ownership and acquisition, operation and maintenance responsibilities, and the community education and outreach required for each project. Prior to this meeting, draft materials will be posted to the internet and distributed through available e-mail lists to provide opportunity for review before the meeting.

#### **5.2.1 Agenda for the Second Stakeholder Meeting**

1. Present draft conceptual projects and benefit prioritization
2. Request input on additional potential locations/projects for consideration

### **5.3 Third Stakeholder Meeting**

During the third Stakeholder meeting, the final project descriptions, benefits, and prioritization results will be presented. Prior to this meeting, a draft public SWRP will be posted to the internet and distributed through available e-mail lists to provide opportunity for review before the meeting. This step will help cultivate and develop partnerships required for SWRP implementation and long-term maintenance.

#### **5.3.1 Agenda for third Stakeholder Meeting**

1. Public draft SWRP

## 6 DISADVANTAGED AND CLIMATE VULNERABLE COMMUNITIES

The City of Redding has several economically disadvantaged communities (DAC) and economically distressed areas (EDA) based on the 2014 American Community Survey median household income by census block group. Disadvantaged areas have a median household income of less than 80% of the state’s median household income, while severely disadvantaged areas have less than 60%. This corresponds to a median income below \$49,191 in disadvantaged areas and below \$36,893 in severely disadvantaged areas. Approximately 49 percent of the area (and 72 percent of the population) within the City is disadvantaged and 25 percent (or 36 percent of the population) is considered severely disadvantaged, with the severely disadvantaged area included as a subset of the disadvantaged area. For reference, the MHI the City of Redding is \$43,773. Currently available information indicates that there are no climate vulnerable communities within the City of Redding. However, if Stakeholders demonstrate that they live in a climate vulnerable community, then special attention will be made regarding the inclusion of their area in the SWRP.

### 6.1 Runoff-Related Environmental Injustice Issues

The first step in effective outreach is to identify DACs that have an interest and stake in the planning outcome. This is accomplished by developing and maintaining a comprehensive listing of disadvantaged community representatives, and as applicable, community organizations, environmental stewardships organizations, and advocacy groups as part of the overall project stakeholder list. The City will build on the existing list of environmental and community stakeholders and identify additional stakeholders for inclusion on the list. With participation from DAC community representatives at the public workshops, there will be opportunities to identify and address specific runoff-related environmental injustice issues.

## 7 SCHEDULE FOR INITIAL PUBLIC ENGAGEMENT AND EDUCATION

Ongoing communication with the public will be conducted through emails and publicly posted meeting announcements and draft deliverables on the City website. Below is a summary of key milestones for public engagement and education in the initial SWRP development phase of the project.

## 8 HOW TO GET INVOLVED

Outreach and stakeholder identification will be conducted through focused phone calls, emails, and public notices. Public notice will be provided via fliers, posters, newspapers and newsletters, social media, and/or websites. All outreach will be documented with sign-in sheets, meeting photographs, website and flyer examples, and meeting notes.

Individuals interested in participating in the SWRP process should contact Mieke Sheffield. Ms. Sheffield can be reached via:

email: [msheffield@ci.redding.ca.us](mailto:msheffield@ci.redding.ca.us)

address: 777 Cypress Avenue, Redding, CA 96001

telephone: (530) 225-4889

All comments shall be submitted to Mieke Sheffield according to the schedule above.

# Appendix A – Initial Stakeholders

Updated November 28, 2018

Several key Stakeholders have presented an interest in participating in the SWRP process that represent a variety of interests including local ratepayers, developers, locally regulated commercial and industrial businesses, nongovernmental organizations, nonprofit organizations and the general public. The below list of participating Stakeholders serves as an initial list that will be updated with any other groups or individuals that present an interest in participating in the SWRP process.

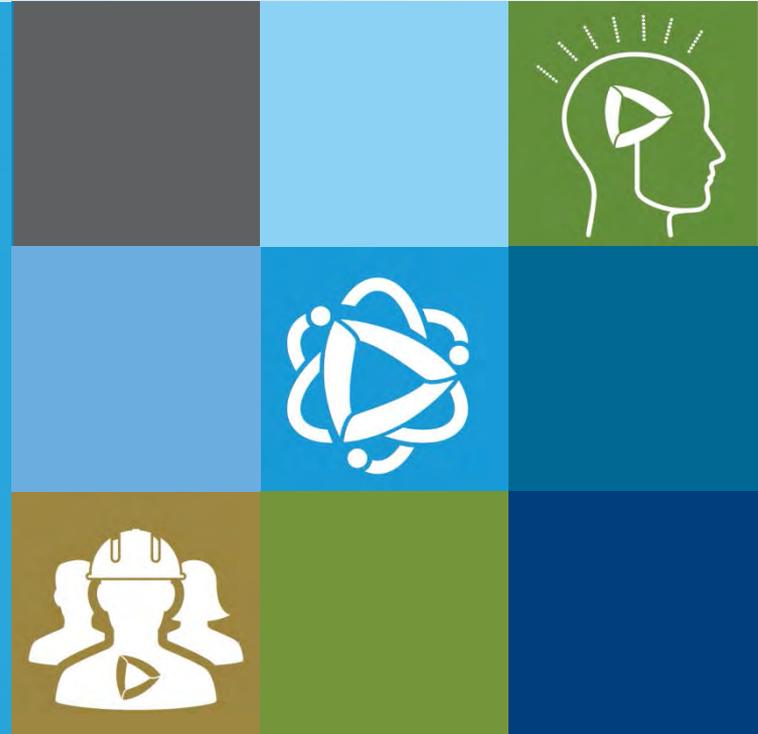

Type	Affiliation
City/County	City of Anderson
	City of Shasta Lake
	County of Shasta Health and Human Services Agency
	County of Shasta Public Works
Special Districts	Western Shasta Resource Conservation District
	Shasta Mosquito and Vector Control District
Other Public Agencies	Caltrans
	Shasta College
Non- Governmental Organizations	Shasta Environmental Alliance*
	Sierra Club
	Audubon
	Shasta MRCDC
	Shasta Living Streets*
* nonprofit organizations working on stormwater and dry weather resource planning or management in the watersheds	

## **SECTION 4. STAKEHOLDER PRESENTATIONS**

# City of Redding Stormwater Resource Plan

Stakeholder Kickoff Meeting  
January 11, 2018

# Discussion Topics

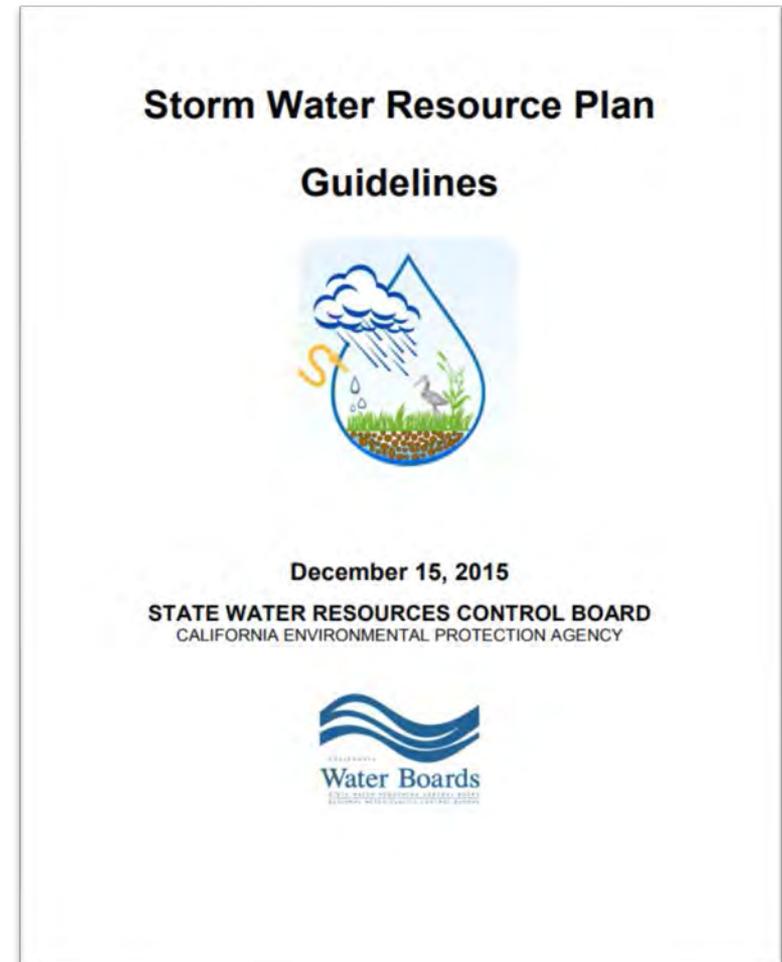

- Stormwater Resource Plan (SWRP) project goals
- SWRP project collaboration
- Identification and Prioritization of Projects
- Wrap up

# Stormwater Resource Plan Project Goals

- **Senate Bill (SB) 985, the Stormwater Resources Planning Act**
  - requires development of a Storm Water Resource Plan to receive grant funds
- **The Water Quality, Supply, and Infrastructure Improvement Act (Proposition 1)**
  - provides \$200 million for matching grants

# SWRP Requirements

- Identify watershed and subwatersheds
- Identify pollutant sources
- Consistent with other plans and permits
- Prioritize project based on multiple benefits
- Community participation
- Submit to Integrated Regional Water Management (IRWM) Group

**TABLE 3. BENEFIT METRICS**

Benefit	Example	Metric Unit(s)
<b>Water Quality</b> <i>while contributing to compliance with applicable permit and/or TMDL requirements</i>	Increased filtration and/or treatment of runoff	<b>Pollutant Load Reduction</b> pounds (lbs)/day kilograms (kg)/day milligram/Liter microgram /Liter
	Nonpoint source pollution control	most probable number of bacteria or indicator organisms (mpn)/mL
	Reestablished natural water drainage and treatment	<b>Volume Treated</b> million gallons per day (mgd) acre-feet per year (afy)
<b>Water Supply</b> <i>through groundwater management and/or runoff capture and use,<sup>11</sup></i>	Water supply reliability	<b>Volume Captured</b> <i>in terms of augmentation/replacement of water supply, or reduced dependence on imported water</i>
	Water conservation	million gallons per day (mgd) acre-feet per year (afy)
	Conjunctive use	<b>Cost</b> dollars per volume per year (of augmented water supply)
<b>Flood Management</b>	Decreased flood risk by reducing runoff rate and/or volume	<b>Rate, Volume, and/or Size</b> cubic feet per second (cfs) acre-feet (af) cubic feet (cf) acres or linear feet
	Reduced sanitary sewer overflows	
<b>Environmental</b>	Environmental and habitat protection and improvement, including: - wetland enhancement/creation; - riparian enhancement; and/or - instream flow improvement	<b>Size and/or Rate</b> acres cubic feet per second (cfs) carbon sequestration (megagrams of carbon per area)
<b>Environmental (continued)</b>	Increased urban green space	<b>Other<sup>12</sup></b> area units of landscape and buffer measure of improved hydrology number of biotic structure number of physical structures
	Reduced energy use, greenhouse gas emissions, or provides a carbon sink	
	Reestablishment of the natural hydrograph	reduced temperature (degrees)
	Water temperature improvements	
<b>Community</b>	Enhanced and/or created recreational and public use areas	<b>Size</b> size of population served number of people number of jobs acres
	Community involvement	
	Employment opportunities provided	

# Primary Goals and Mission

Develop a forward-thinking SWRP that includes:

- Prioritizing water quality concerns
- Community education
- Identification of projects that bring value and benefit to the community
- Collaborative development
- Local project support
- Opportunities for future grant funding

# The End Product

# Stakeholder Meetings

- **1st Stakeholder Meeting – Week of 1/9/18**
  - Project overview
  - Present draft parcel screening and prioritization
  - Request other potential locations/projects for consideration
- **2nd Stakeholder Meeting – March 2018**
  - Present draft conceptual projects and benefit prioritization
  - Request other potential projects for inclusion
- **3rd Stakeholder Meeting – June 2018**
  - Present public draft SWRP

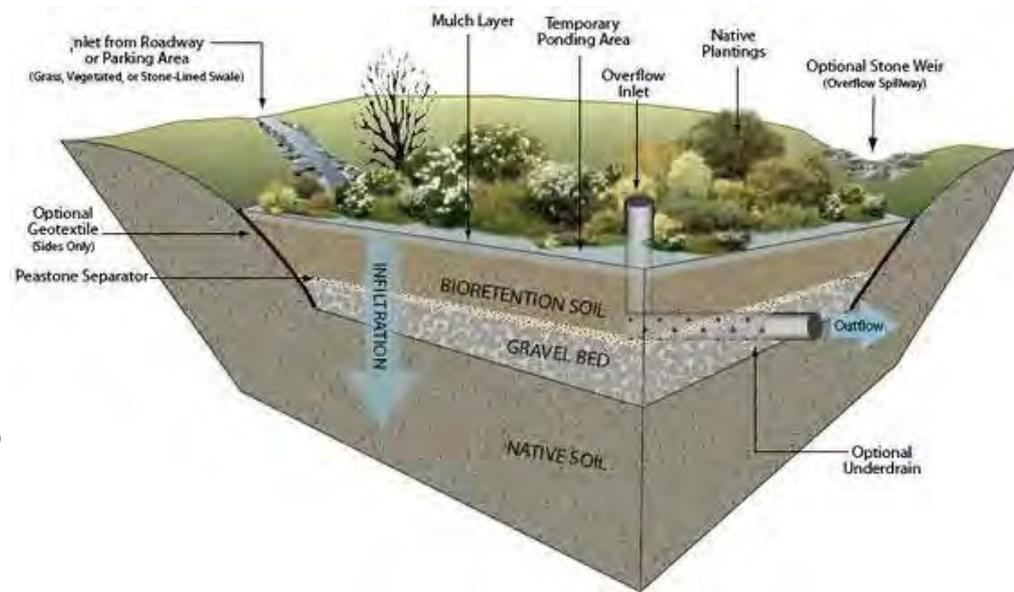

# Project Milestones

# Identification and Prioritization of Projects

- **Benefits**
  - Cost effective
  - Pollutant removal
  - Recharge groundwater
  - Aesthetic improvements
- **Constraints**
  - Poor infiltrative soils
  - Significant space requirements

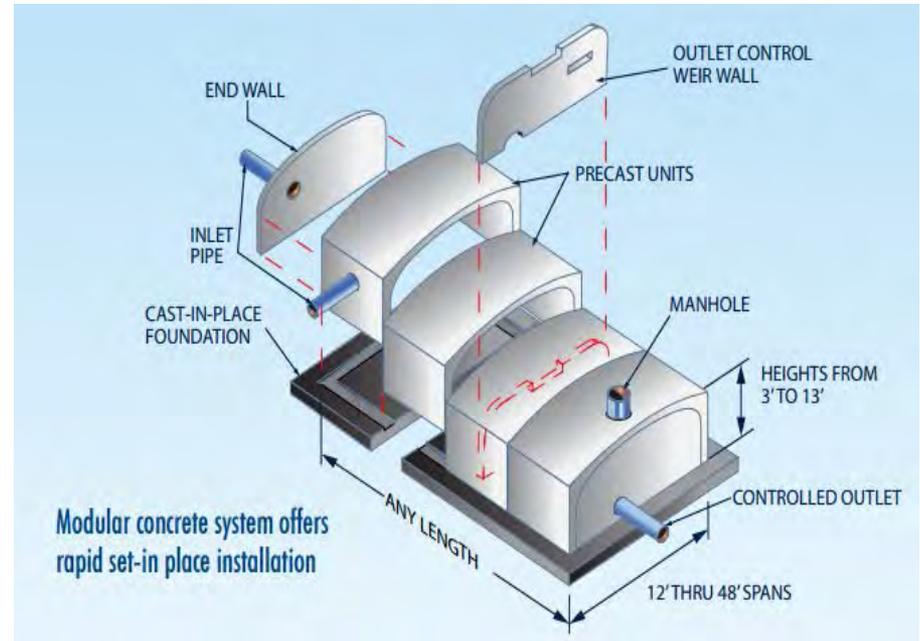

- **Benefits**
  - High pollutant concentration removal
  - Community greening
  - Combined with planned street improvements
- **Constraints**
  - Space limited
  - Expensive to install

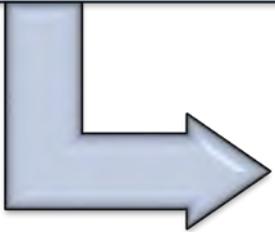

- **Benefits**
  - Off-set potable water demand
  - Pollutant removal
  - Minimal footprint and installation constraints
- **Constraints**
  - Expensive to install, operate, and maintain
  - Need ongoing demand for water captured

# Project Identification and Prioritization Approach

## Screen and Prioritize Parcels

- 35,663 total parcels in the city
- 434 feasible parcels
- 3,927 feasible green streets
- 25 recommended parcels

## Project Description

This project plans to revitalize existing stormwater infrastructure to allow for water quality treatment and recharge of groundwater. An existing detention basin is located at the southern end of Hans Christian Andersen Park located adjacent to the Skytt Mesa housing development. The proposed site receives stormwater from a 60-inch storm drain which collects runoff from a primarily residential, 64 acre drainage area. The existing detention basin will be deepened and expanded into an infiltration basin designed to store 140,000 cu-ft. The existing detention basin is owned and operated by the City of Solvang, and there is currently a Lighting and Landscape Maintenance Division (LLMD) in place for the residential neighborhood that includes maintenance of the basin.

## Potential Site Constraints:

Vegetation in the basin area should be inspected prior to finalizing the project design to confirm no oak or other protected species are present.

## Example Infiltration Basin (proposed concept)

### Project Drainage Area

### Project Overview

Parcel Ownership	City of Solvang
APN	137-670-001
Soil Type	Hydrologic Soil Group A
Watershed	Santa Ynez
Groundwater Basin	Santa Ynez River Valley
Jurisdiction(s)	City of Solvang

Note: Proposed project is conceptual and subject to change based on future feasibility assessment, funding availability, and/or other information.

# Conceptual Project Development – Template Sheet 2

**DRAFT FOR DISCUSSION ONLY. DO NOT DISTRIBUTE.**

## Project Benefits

All benefits are expressed as an average annual estimate based on historical modeling.

### Water Quality:

Drainage Area Pollutant Reductions	
TSS (lbs)	9,700
NO3 (lbs)	61
Dissolved Cu (lbs)	0.74
Fecal Coliform (MPN)	5.4

State impaired water list identified these pollutants as elevated in the receiving waters.

### Water Supply:

Recharged Groundwater Volume  
19 acre-feet

Equivalent Households Supplied

**Flood Management:** 29 acre-feet (74%) of runoff will be removed annually from the stormdrain system. All of the runoff generated from an 85th percentile 24-hr storm will be captured and infiltrated.

**Environmental Enhancements:** Infiltrated water will enhance the park greenspace and promote vegetation, increasing the habitat value.

**Community Enhancements:** Signage to educate public about the projects multiple benefits; and native vegetation and landscaping will improve the aesthetics of the parcel.

## Design Criteria

	85th Percentile, 24-hr Storm	Long-Term Average Annual
Precipitation (in)	1.18	16.8
Runoff Volume (ac-ft)	2.7	39
Percent of Runoff Volume Captured (%)	>100	74
Total Volume Captured (ac-ft)	2.7	29

# Conceptual Project Selection

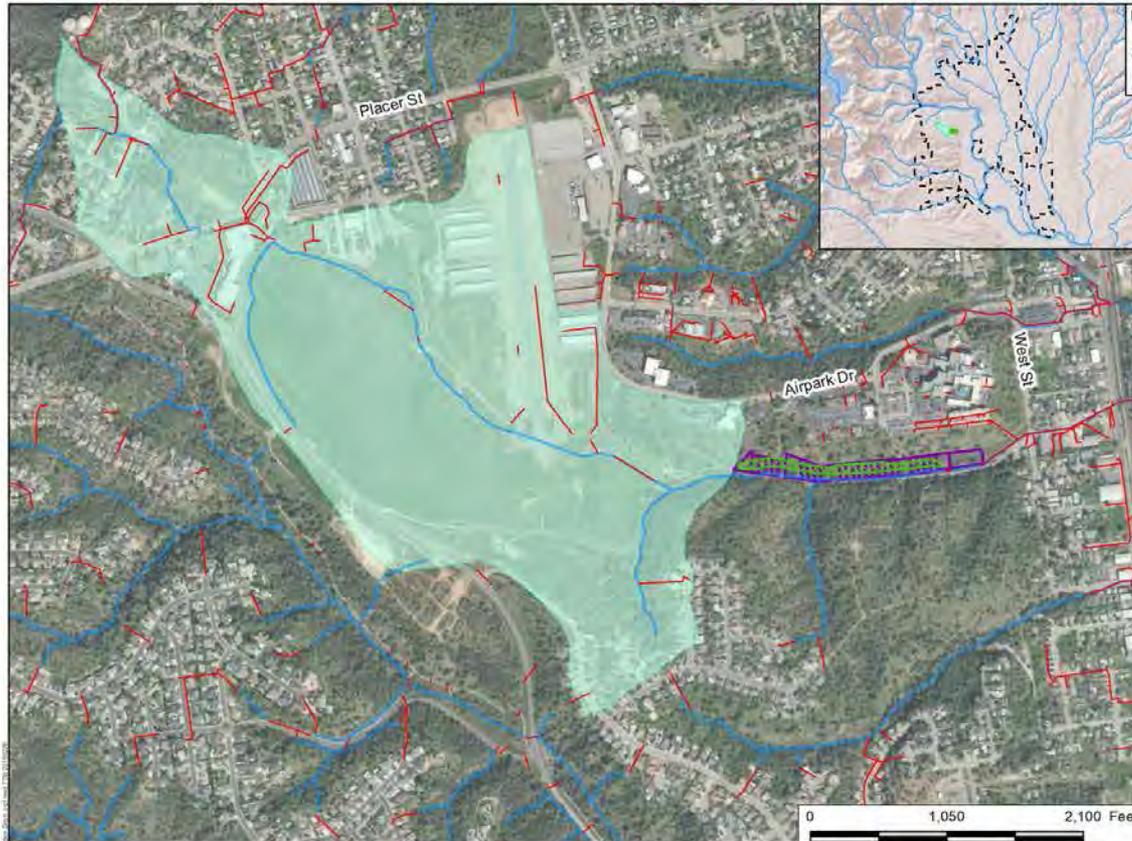

Project Location	Project Type	Parcel	Short Description
Linden Ditch	Infiltration System	26 parcels owned by the City	Offline infiltration system adjacent to the current creek to improve water quality, reduce flows, and recharge groundwater.
Mary Lake Pond	Wet Basin (with extended detention), Storage Tank, and Lake Dredging	204350040000, 204560040000, 204330030000	Enhanced wet basin with additional storage, a new storage tank to provide water supply during summer months, dredging of the main lake.
Old City Sewer Ponds	Wet Basin (with extended detention)	116180006000, 117070028000	Utilize existing abandoned sewer ponds to treat, detain, and infiltrate flows from Boulder Creek and enhance environmental functions and values of the creek corridor.
Pine Alley	Porous Pavement and rain garden	Market-Pine Alley at Eureka Way	Convert the alley between Market and Pine Street in downtown Redding into a green pedestrian corridor by replacing the existing surface with permeable pavement and rain gardens

# Linden Ditch

**DRAFT FOR DISCUSSION ONLY. DO NOT DISTRIBUTE.**

## Project Description

This project plans to improve water quality, reduce flows in Linden Ditch, and recharge groundwater by building an offline infiltration system adjacent to the current flow path. Water will be diverted from Linden Ditch approximately where it meets Linden Avenue and directed into the elongated infiltration basin before flowing back into Linden Ditch upstream of West Street. The basin will be located exclusively on city owned parcels and include a pretreatment area. Vegetation, walking paths, and interpretive signage will be incorporated.

## Potential Site Constraints:

Vegetation and animals in the basin area should be inspected prior to finalizing the project design to confirm no protected species are present. Additional permitting may be required for vegetation removal. A site survey should be conducted to confirm elevations and infiltration rate in the project site.

  - Direction of Flow

**Project Design Information**

BMP Type	Infiltration System
Total Project Footprint	1.7 acres (includes 0.43 acre pretreatment)
Depth	7 ft (including 1 ft freeboard)
Storage Volume	7.6 ac-ft
Assumed Infiltration Rate	1.5 in/hr
Stormwater Source	Linden Ditch

Note: Proposed project is conceptual and subject to change based on future feasibility assessment, funding availability, and/or other information.

**Project Benefits**

All benefits are expressed as an average annual estimate based on historical long-term modeling.

**Overall Multi-Benefit Score**  
Highest possible score is a 5

**Water Quality:**

Pollutant Load Reductions from Drainage Area

	Reduced	Remaining
TSS (lbs)	77,000	
NO3 (lbs)	440	
Dissolved Cu (lbs)	2.9	
Fecal Coliform (MPN)	9.4E-12	

**Environmental Enhancements:** Infiltrated water will enhance the greenspace and promote vegetation, increasing the habitat value.

1.7 acres of habitat restored

**Flood Management:** 170 acre-feet (68%) of the average annual runoff will be removed annually from flowing through the concrete channelized portion of Linden Ditch which runs through the city. All of the runoff generated from an 85th percentile 24-hr storm will be captured and infiltrated.

**Community Enhancements:** Signage to educate public about the project's multiple benefits; and native vegetation and landscaping will improve the aesthetics of the parcel.

**Water Supply:** Assuming 65% of the infiltrated water reaches groundwater, 110 acre-feet will be recharged annually, which is equivalent to the supply for 270 households.

**Volume Capture Analysis**

	85 <sup>th</sup> Percentile, 24-hr Storm	Long-Term Average Annual
Precipitation (in)	0.91	37.5
Runoff Volume (ac-ft)	5.9	250
Percent of Runoff Volume Captured (%)	>100	68

Parcel Ownership	City of Redding
APN	204350040000, 204560040000, 204330030000
Soil Type	Hydrologic Soil Group C
Watershed	Churn Creek-Sacramento River
Receiving Water	Jenny Creek
Groundwater Basin	Outside of Anderson

Note: Proposed project is conceptual and subject to change based on future feasibility assessment, funding availability, and/or other information.

**Project Description**

This project plans to improve water quality in Mary lake by revitalizing the existing wet detention basin above Mary Lake to allow for increased water quality treatment and storage capacity. The revitalization may include reconfiguration of the flow path, increased berm height at the downstream end, sediment removal, and native habitat restoration. Flow into Mary Lake will be controlled by adding an adjustable weir or closable orifice at the low point of the upper basin. A storage tank is also proposed to be built adjacent to the upper basin. This will enable peak flows from winter storms to be captured for release during the dry months to maintain lakes and reduce eutrophication. Dredging of Mary Lake will also support increased capacity and removal of legacy nutrients.

**Potential Site Constraints:**

Vegetation and animals in the basin area should be inspected prior to finalizing the project design to confirm no protected species are present. A site survey should be conducted to confirm elevations of the project site. Additionally, numerous permits will need to be acquired to implement this project (RWQCB, CDFW, Army Corps, County, etc.).

# Mary Lake

**DRAFT FOR DISCUSSION ONLY. DO NOT DISTRIBUTE.**

Legend		Project Design Information		
	Waterbody	BMP Type	Wet Basin	Storage Tank
	Storm Drain	Total Project Footprint	2.1 acres (includes 0.69 acre pretreatment)	0.50 acres
	Flow Diversion	Depth (inc. 1 ft freeboard)	3-5.5 ft	9 ft
	Parcel Boundary	Storage Volume	12 ac-ft	4.0 ac-ft
	Direction of Flow	Assumed Infiltration Rate	negligible	N/A
	Lake Restoration	Stormwater Source	36 and 24 inch storm drains owned by City	Wet Basin
	Natural Treatment System			
	Storage Tank			

Note: Proposed project is conceptual and subject to change based on future feasibility assessment, funding availability, and/or other information.

## Project Benefits

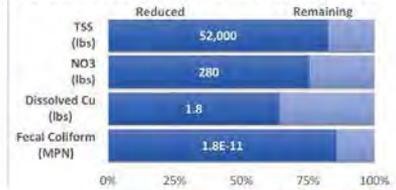

All benefits are expressed as an average annual estimate based on historical modeling.

**Overall Multi-Benefit Score**  
Highest possible score is a 5

## Water Quality:

Pollutant Load Reductions from Drainage Area

**Environmental Enhancements:** Captured water will enhance the greenspace and promote vegetation, increasing the habitat value by reducing pollutants and releasing water as needed into Mary Lake to maintain beneficial water levels.

**Flood Management:** 130 acre-feet (86%) of the average annual runoff will be delayed annually from flowing through Mary Lake and into Jenny Creek. All of the runoff generated from an 85th percentile 24-hr storm will be captured and slowly released.

**Community Enhancements:** Signage to educate public about the project's multiple benefits; and native vegetation and landscaping will improve the aesthetics of the parcel.

**Water Supply:** The storage tank and the adjustable weir in the upper lake are designed to capture and store 9.1 acre-feet for supplying Lake Mary during the summer months. This reduces the volume of potable water used for this purpose.

## Volume Capture Analysis

	85 <sup>th</sup> Percentile, 24-hr Storm	Long-Term Average Annual
Precipitation (in)	0.91	37.5

# Former Sewer Ponds

**DRAFT FOR DISCUSSION ONLY. DO NOT DISTRIBUTE.**

## Project Description

This project plans to revitalize existing infrastructure to allow for water quality treatment through a series of wet basins with extended detention. The abandoned sewer ponds are located adjacent to Boulder Creek, which is a salmonid stream and receives significant runoff from areas considered high priority for trash and pollution control. Water will be diverted from Boulder Creek just after it crosses under the I-5 freeway and flow through the wet basins before flowing back into Boulder Creek. The upper basin will be expanded and include a pretreatment area while the lower basin will retain its current footprint. Vegetation, walking paths, and interpretive signage will be incorporated.

## Potential Site Constraints:

The basin area should be inspected prior to finalizing the project design to confirm no protected species are present. Also necessary ecological instream flows within Boulder Creek along the project location should be confirmed to assist with the design of the project. Numerous permits will need to be acquired to implement this project (RWQCB, CDFW, Army Corps, County, etc.)

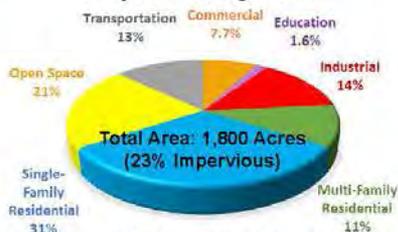

## Example Wet Basins in Construction

# Former Sewer Ponds

**DRAFT FOR DISCUSSION ONLY. DO NOT DISTRIBUTE.**

- Legend**
- Waterbody
  - Storm Drain
  - Flow Diversion
  - BMP Footprint
  - Parcel Boundary
  - Direction of Flow

**Project Design Information**

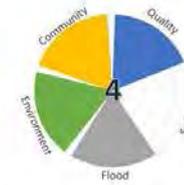

BMP Type	Wet basins with extended detention
Total Project Footprint	13 acres (includes 3.3 acres pretreatment)
Depth	3-9 ft (includes 1 ft freeboard)
Storage Volume	41 ac-ft
Assumed Infiltration Rate	negligible
Stormwater Source	Boulder Creek

Note: Proposed project is conceptual and subject to change based on future feasibility assessment, funding availability, and/or other information.

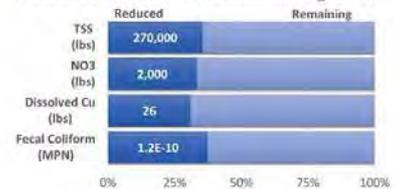

**Project Benefits**

All benefits are expressed as an average annual estimate based on historical modeling.

**Overall Multi-Benefit Score**  
Highest possible score is a 5

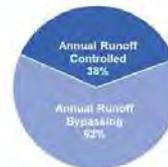

**Water Quality:**  
Pollutant Load Reductions from Drainage Area

**Environmental Enhancements:** Captured water will enhance the park greenspace and promote vegetation, increasing the habitat value.

**Flood Management:** 920 acre-feet (38%) of the average annual runoff will be delayed from flowing down Boulder Creek. 77% of the runoff generated from an 85th percentile 24-hr storm will be captured and slowly released back into Boulder Creek.

**Community Enhancements:** Signage to educate public about the project's multiple benefits; and native vegetation and landscaping will improve the aesthetics of the parcel.

**Water Supply:** There are no water supply benefits, because infiltration is assumed to be negligible.

**Volume Capture Analysis**

	85 <sup>th</sup> Percentile, 24-hr Storm	Long-Term Average Annual
Precipitation (in)	0.91	37.5
Runoff Volume (ac-ft)	59	2,400
Percent of Runoff Volume Captured (%)	77	38
Total Volume Captured (ac-ft)	46	920

# Market-Pine Alley

**DRAFT FOR DISCUSSION ONLY. DO NOT DISTRIBUTE.**

## Project Description

This project plans to turn the alley between Market and Pine Street in downtown Redding into a green pedestrian corridor by replacing the existing surface with permeable pavement and rain gardens with an underdrain system. The stormwater will be collected from the busy area near Eureka Way via the existing storm drains and surface runoff. Permeable pavement and rain gardens will reduce the amount of ponding in the alley and provide water quality treatment by allowing the stormwater runoff to percolate into the underdrain system.

## Potential Site Constraints:

Business owners on either side of the alley should be coordinated with during planning and construction stages since the alley provides access to some parking areas. Percolation testing should be conducted to confirm assumed infiltration rates. Additionally subsurface utilities may need to be relocated.

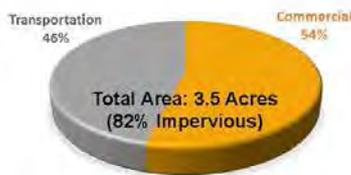

## Location of Proposed Green Street

# Market-Pine Alley

**DRAFT FOR DISCUSSION ONLY. DO NOT DISTRIBUTE.**

## Legend

- Waterbody
- Storm Drain
- Flow Diversion
- BMP Footprint
- Parcel Boundary
- Direction of Flow

## Project Design Information

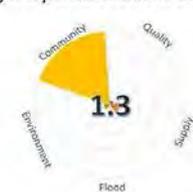

BMP Type	Green Street
Total Project Footprint	0.16 acres (includes 0.041 acre pretreatment)
Depth	2.3 ft
Storage Volume	0.14 ac-ft
Assumed Infiltration Rate	0.32 in/hr
Stormwater Source	Surface Runoff

Note: Proposed project is conceptual and subject to change based on future feasibility assessment, funding availability, and/or other information.

## Project Benefits

All benefits are expressed as an average annual estimate based on historical modeling.

**Overall Multi-Benefit Score**  
Highest possible score is a 5

## Water Quality:

Pollutant Load Reductions from Drainage Area

	Reduced	Remaining
TSS (lbs)	1,300	
NO3 (lbs)	9.0	
Dissolved Cu (lbs)	0.30	
Fecal Coliform (MPN)	2.8E-13	

**Environmental Enhancements:** Captured water will enhance the greenspace and promote vegetation, increasing the habitat value.

0.03 acres of habitat created

**Flood Management:** 5.6 acre-feet (57%) of the average annual runoff will be removed annually from the stormdrain system. About half of the runoff generated from an 85th percentile 24-hr storm will be captured and infiltrated.

**Community Enhancements:** Signage to educate public about the project's multiple benefits; and native vegetation and landscaping will improve the aesthetics of the alley.

**Water Supply:** Assuming 65% of the infiltrated water reaches groundwater, 2.1 acre-feet will be recharged annually, which is equivalent to the supply for 5.1 households.

## Volume Capture Analysis

	85 <sup>th</sup> Percentile, 24-hr Storm	Long-Term Average Annual
Precipitation (in)	0.91	37.5
Runoff Volume (ac-ft)	0.21	8.7
Percent of Runoff Volume Captured (%)	48	57
Total Volume Captured (ac-ft)	0.10	5.6

# Quantified Benefits

Project Location	Project Type	Project Footprint (acres)	Annual Pollutant Load Reductions*					Water Supply (acre-ft/yr)*	Runoff Volume Controlled (cu ft/yr)
			TSS (lb/yr)	Diss P (lb/yr)	NO3 (lb/yr)	Diss Cu (lb/yr)	Fecal Coliform (10 <sup>12</sup> MPN/yr)		
Downtown Mall	Porous pavement and rain garden	0.46	2,600	5.1	15	0.22	0.34	3.4	340,000
Mary Lake Pond	Wet Basin (with extended detention)	2.6	52,000	72	280	1.8	18	9.1	5,700,000
Old City Sewer Ponds	Wet Basin (with extended detention)	13	270,000	610	2,000	26	120	0	40,000,000
Linden Ditch	Infiltration System	1.7	77,000	87	440	2.9	9.4	110	7,300,000
Pine Alley	Porous pavement and rain garden	0.16	1,300	5.9	9	0.3	0.28	2.1	240,000

\*Only a selection of key pollutants are shown. 12 pollutants were modeled and all the load reductions will be included in the SWRP.

\*\* Water supply benefits are for project planning only and are not to be used for forecasting water supply.

**Draft discussion only, please do not distribute.**

# Multi-Benefit Prioritization

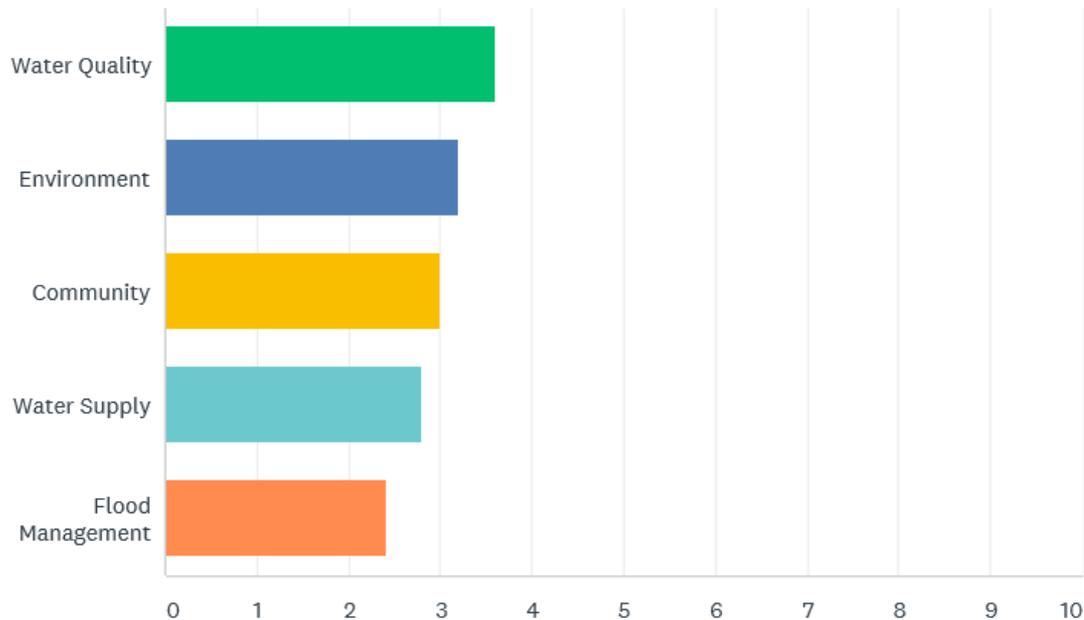

Benefit Category	Quantitative Benefit	Qualitative Benefit Weighting	Multi-Benefit Weight
Water Quality	Multi-pollutant load reduction	1 = Non-urban non-listed pollutant 2 = Urban non-listed pollutant 4 = 303(d) listed 5 = TMDL listed	30%
Water Supply	Potential water supply volume	0 = No infiltration or planned use 1 = Provides infiltration in a confined aquifer not used for water supply 2 = Improved water efficiency through drought tolerant vegetation and/or removal of high water need vegetation 3 = Provides groundwater recharge in an unconfined aquifer that is not used for water supply 4 = Provides infiltration in a confined aquifer used for water supply 5 = Provides infiltration in a unconfined aquifer used for water supply	20%
Flood Management	Runoff volume controlled	0 = No flooding problem known to occur locally 1 = Minor alleviation of a local flooding problem 3 = Minor flooding problem known to occur locally 5 = Significant flooding problem known to occur locally	20%
Environment	Environmental Enhancement Area	0 = No environmental benefit 1 = One additional environmental benefits and no main benefits 3 = Medium environmental benefit 5 = High environmental benefit	20%
Community		0 = No community benefit 1 = One additional community benefits and no main benefits 3 = Medium community benefit 5 = High community benefit	10%

# Priorities for Benefits

The final four projects will be prioritized using five weighted categories. Please assist the Technical Advisory Committee in weighting these categories by telling us which project benefits are most important to you. Please assign a rank to each of the five categories. \*A number "1" indicates this project benefit is a higher priority. \*A number "5" indicates this project benefit is a lower priority.

Answered: 5 Skipped: 0

# Qualitative Benefit Weights

Project Location	Project Type	Qualitative Benefit Weights				
		Water Quality*	Water Supply	Flood Management	Environmental	Community
Downtown Mall	Porous pavement and rain garden	1.4	3	1	5	5
Mary Lake Pond	Wet Basin (with extended detention)	1.4	5	1	5	5
Old City Sewer Ponds	Wet Basin (with extended detention)	1.4	3	5	5	5
Linden Ditch	Infiltration System	1.4	3	5	5	5
Pine Alley	Porous pavement and rain garden	1.4	3	1	5	5

\*The values shown here represent the average qualitative score of all pollutants.

Shading from light blue to dark blue indicates low to high values

# Multiple Benefit Scores

Project Location	Project Type	Overall Benefit Scores					Multi-Benefit Index
		Water Quality	Water Supply	Flood Management	Environmental	Community	
Linden Ditch	Infiltration System	4.7	3	5	3.4	5	4.2
Old City Sewer Ponds	Wet Basin (with extended detention)	5	0	5	5	5	4.0
Mary Lake Pond	Wet Basin (with extended detention)	3.2	5	0.78	5	5	3.8
Downtown Mall	Porous pavement and rain garden	0.29	1.1	0.047	0.91	5	1.5
Pine Alley	Porous pavement and rain garden	0.30	0.69	0.033	0.32	5	1.3

Shading from light blue to dark blue indicates low to high values

# Prioritization – Cooperating Entity Projects with Quantified Benefits

Project Location	Project Type	Multi-Benefit Index	Prioritization (low, medium, or high)
Linden Ditch	Infiltration System	4.2	High
Old City Sewer Ponds	Wet Basin (with extended detention)	4.0	High
Mary Lake Pond	Wet Basin (with extended detention)	3.8	High
Downtown Mall	Porous pavement and rain garden	1.5	High
Pine Alley	Porous pavement and rain garden	1.3	High

- High: Multi-benefit index  $> 0$  and project has a willing land owner that is committed to maintenance
- Medium: Multi-benefit index  $> 3$  and project does not have a willing or public land owner or that is committed to maintenance
- Low: Multi-benefit index  $\leq 3$  and project does not have a willing or public land owner that is committed to maintenance

Draft discussion only, please do not distribute.

# Qualitative Benefits

Benefit Category	None	Low	Medium	High
<b>Water Quality</b>	No pollutant removal	Low removal in discharge	Medium removal in discharge	Full removal of captured/diverted flow
<b>Water Supply</b>	No infiltration or planned use	Improved water efficiency through drought tolerant vegetation and/or removal of high water need vegetation	Some recharge of groundwater or direct use	Significant recharge of groundwater or direct use
<b>Flood Management</b>	No alleviation of a local flooding problem	Minor alleviation of a local flooding problem	Medium alleviation of a local flooding problem	Significant alleviation of a local flooding problem
<b>Environmental</b>	No environmental benefit	One (or more) additional environmental benefits and no main benefits	One main environmental benefit	Two (or more) main environmental benefits
<b>Community</b>	No community benefit	One (or more) additional community benefits and no main benefits	One main community benefit	Two (or more) main community benefits

# Prioritization – Projects with Qualified Benefits

Proposed by	Project Name	Project Type	Watershed	Qualitative Benefit Score (0, 1, 3, or 5)					Multi-Benefit Index	Priority

# Wrap up

# Primary Goals and Mission

Develop a forward-thinking SWRP that includes:

- Prioritizing water quality concerns
- Community education
- Identification of projects that bring value and benefit to the community
- Collaborative development
- Local project support
- Opportunities for future grant funding

## TAC Actions Needed

- Comment on presentation and design concepts (3/12)
- Continue to provide additional projects for inclusion
- Stakeholder meeting (week of June 4)

# Group Discussion

[Help](#) **Submit Data for this Project**

# Ongoing Coordination

- Among TAC (as needed)
  - SWRP E-mail updates
  - Meetings to discuss significant items
- With Community
  - During project design and construction
  - Email notice of significant updates to the plan
  - Information distributed on City website
    - [www.cityofredding.org/departments/public-works/environmental-management/storm-water-management](http://www.cityofredding.org/departments/public-works/environmental-management/storm-water-management)

- Ongoing monitoring will continue
  - Basin wide Groundwater monitoring
  - Sacramento River monitoring
  - **Any other monitoring programs?**
- Ongoing monitoring results analyzed as needed for project specific performance evaluation
- Project specific monitoring to be determined during design phase
- GIS data management: new SWRP geodatabases now contain all relevant geospatial data

# Field Feasibility and 30% Designs

# Sewer Ponds – Field Investigations

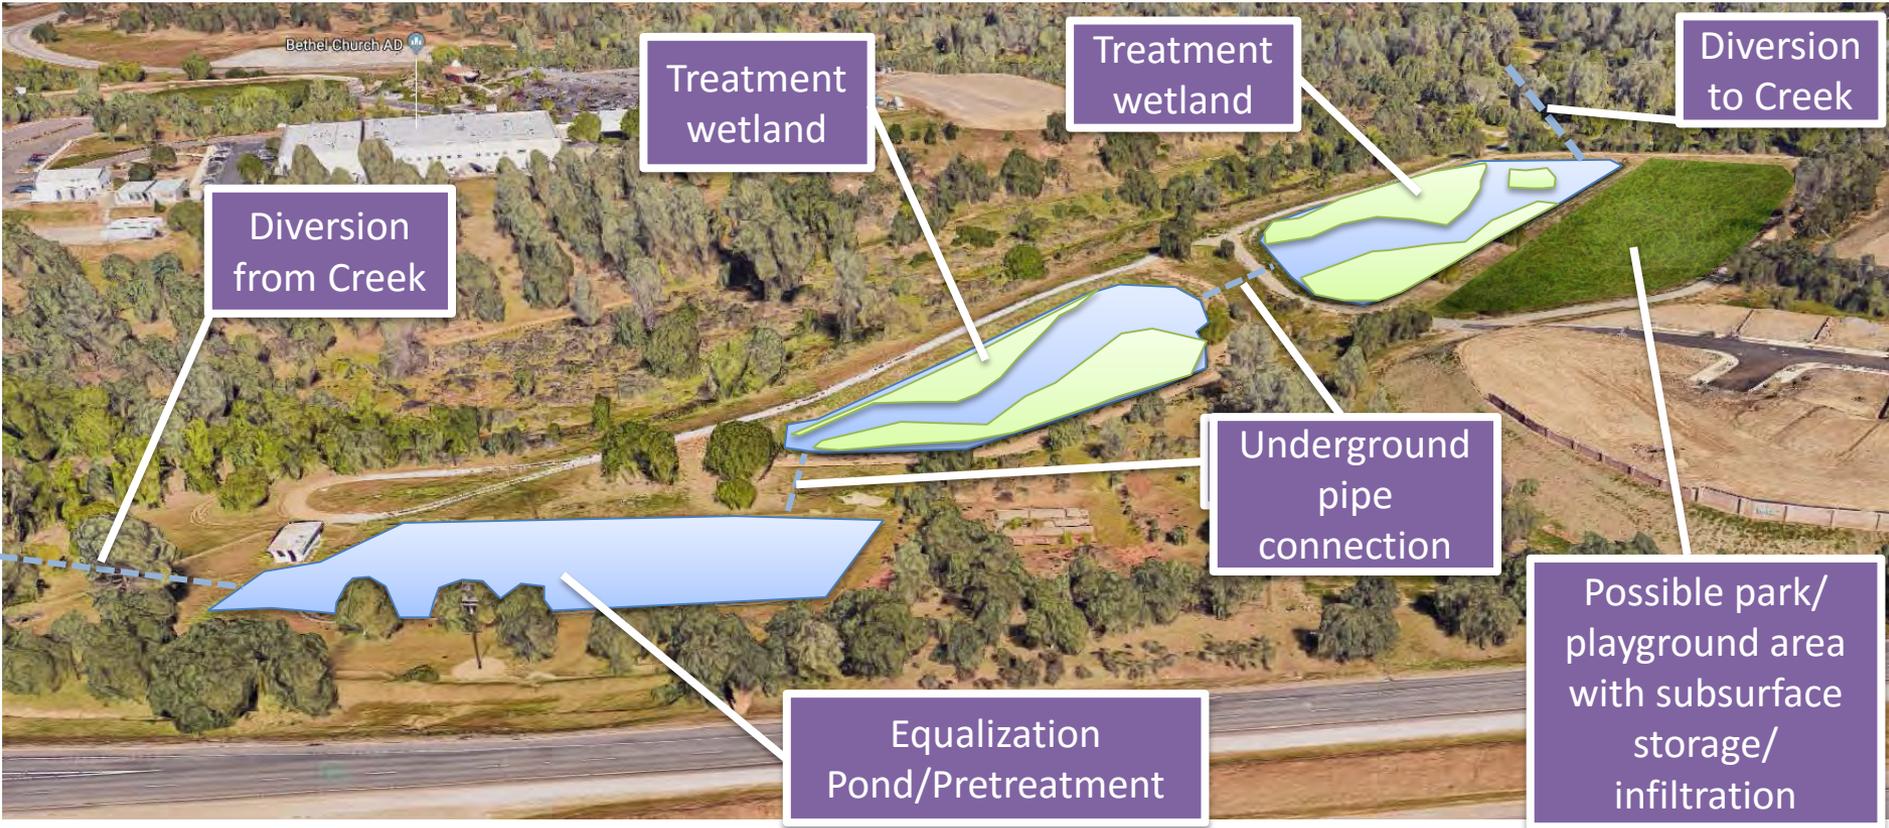

# Sewer Ponds – Field Feasibility

- Many boreholes initiated and abandoned due to gravely/compact soil
- Shallow water present, likely hydraulically connected to the creek
- Infiltration favorable

# Design Layout

# ◆ Sewer Ponds – Design Questions

- Are measured or observed dry weather flowrates available for the creek?
- Beyond the bike path, are there other planned or desired uses to support nearby community?
- Photos available during or immediately after a rain storm?

# Potential Connection Bike Network

# Mary Lake – Field Investigation

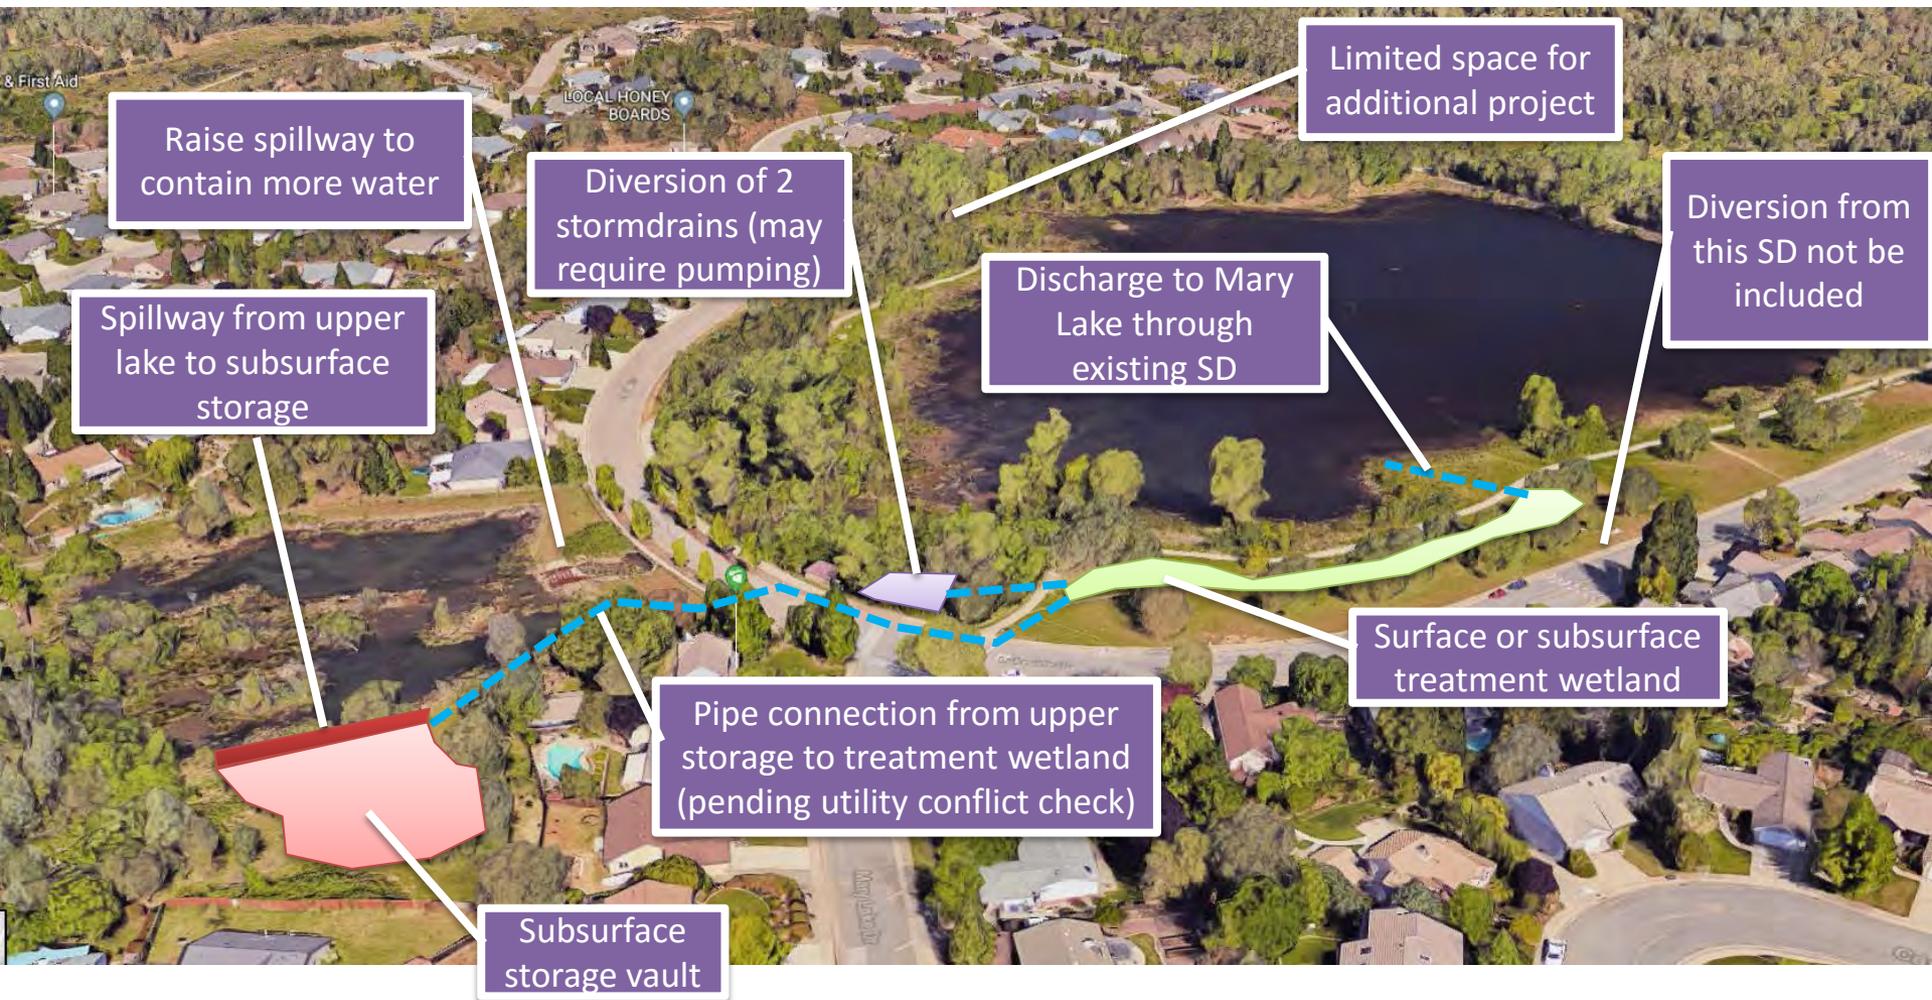

# Mary Lake – Field Feasibility

- Soil testing results suggest shallow water present, likely directly connected to Mary Lake
- Infiltration not recommended as BMP feature

# Mary Lake - Design Layout

# Mary Lake – Design Questions

- Are measured or observed dry weather flowrates available from the stormdrains that discharge to the lake?
- Are there planned or desired uses around the lake to support nearby community?

References .....D-6

## **SECTION 1. ANNOTATED LIST OF EXISTING REPORTS**

Table D-1 contains a description of each report and identifies specific relevant information and data sets.

**Table D-1. Existing Reports**

Name of Report	Description	Surface Water/Hydrology						Groundwater/Geology					Agency Details				Other			
		Precipitation and Evapotranspiration	Watershed/Drainage Systems	Stormwater Capture Facilities	Surface Water Quality	Water Quality Limits/Designations	Other Surface Hydrology	Groundwater Level	Groundwater Quality	Groundwater Basins	Wells	Other Groundwater/Aquifer Characteristics	Soil Types/Geology	Population	Jurisdictions	Water Infrastructure	Proposed BMPs	Water Supply	Flood Management	Environmental
Final California 2014 and 2016 Integrated Report (303(d) List/305(b) Report), 2017, State Water Resources Control Board	Attachments (303(d) lists) and supporting documents provide information on impaired waterbodies and potential sources of pollution.				x	x													x	
City of Redding Program Effectiveness Assessment and Improvement Plan (PEAIP), 2015, WGR SOUTHWEST, INC.	The City of Redding Program Effectiveness Assessment and Improvement Plan describes the framework for implementing and assessing stormwater BMPs. Section 2.1 identifies pollutants of concern and describes their sources - these include pesticides, nutrients, mercury, pathogens, toxics, invasive species, and trash. The majority of the report is dedicated to outlining how BMPs will be assessed.		x		x														x	x
Urban Water Management Plan, 2015, City of Redding	The Urban Water Management Plan describes the City of Redding service area climate, population, and water demands. Projects future water supply demands and deliveries. Summarizes current water sources and their quality and future supply options.												x	x	x		x			
Northern Sacramento Valley Integrated Regional Water Management Plan, 2014, West Yost Associates	The Northern Sacramento Valley Integrated Regional Water Management Plan (IRWMP) covers a variety of topics. Chapter 1 includes a description of the watersheds, water infrastructure (dams and canals), land use, climate, surface and groundwater resources, areas of biological significance, municipalities, water supply and demands, water quality, and objectives of the IRWMP. Chapter 2 describes in detail the goals of the IRWMP and ranking criteria for proposed projects. Benefits for projects include water supply reliability, flood protection and planning, water quality protection and enhancement, watershed protection and management, IRWM sustainability, and public education and information dissemination. Chapter 5 describes how potential projects were developed and prioritized. The main considerations include the project review process, evaluating impacts and benefits, project integration, local water planning, and local land use planning.				x	x	X	x	x						x	x	x	x	x	x
Water Quality Control Plan for the Sacramento and San Joaquin River Basins, 1998 (amended 2014), Central Valley Regional Water Quality Control Board	The Basin Plan identifies beneficial uses for surface waters and groundwater basins, identifies associated water quality objectives for these users and waterbodies, and includes amendments such as TMDLs.		x		x	x	x		x	x										x
A Roadmap to Watershed Management, 2010, Sacramento River Watershed Program	The report contains information about the Sacramento River Basin, detailed descriptions of watersheds including land use, surface water quality concerns, hydrology, and climate. Existing monitoring programs are briefly discussed.	x	x	x	x		x												x	

Name of Report	Description	Surface Water/Hydrology						Groundwater/Geology					Agency Details				Other			
		Precipitation and Evapotranspiration	Watershed/Drainage Systems	Stormwater Capture Facilities	Surface Water Quality	Water Quality Limits/Designations	Other Surface Hydrology	Groundwater Level	Groundwater Quality	Groundwater Basins	Wells	Other Groundwater/Aquifer Characteristics	Soil Types/Geology	Population	Jurisdictions	Water Infrastructure	Proposed BMPs	Water Supply	Flood Management	Environmental
Groundwater Management Plan for the Redding Groundwater Basin, 2007 update, Shasta County Water Agency	The Groundwater Management Plan for the Redding Groundwater Basin describes the local climate, geology, historic groundwater levels and pump rates, groundwater monitoring and water quality, and users. Delivery demands by land use and water purveyors are summarized in Table 3. The purpose of this plan is to ensure groundwater supply and quality, and to develop a management program.							x	x	x	x		x	x			x			
Redding Basin Water Resources Management Plan Environmental Impact Report, 2007, CH2M HILL	The Redding Basin Water Resources Management Plan Environmental Impact Report discusses several alternatives to improve water supply and reliability in the Redding area and their physical and social effects. The principal alternatives include surface water transfers, groundwater development, or a mix of the two. Both the current (2005) and future (2030) level of development and anticipated water demands are considered. The report includes background information on the study area history; land use; and the current condition of and potential impacts to biological, cultural, groundwater, surface water, power, and other resources.							x	x				x		x		x		x	x
Sacramento and Feather Rivers Diazinon and Chlorpyrifos Basin Plan Amendment, 2007, Central Valley Regional Water Quality Control Board	The Basin Plan identifies beneficial uses for surface waters and groundwater basins, identifies associated water quality objectives for these users and waterbodies, and includes amendments such as TMDLs.		x		x	x													x	
Sacramento Valley Integrated Regional Water Management Plan, 2006, Northern California Water Association, CH2M HILL, GEI Consultants	The Sacramento Valley Integrated Regional Water Management Plan covers water supplies, groundwater management, flood management, stormwater capture, water quality, land use, watershed planning, conservation plans, and more at the regional and county level.				x		x	x	x	x				x	x		x	x	x	x
Sacramento River Hydrologic Region Redding Groundwater Basin - CA Groundwater Bulletin 118, 2004	The Anderson, Enterprise, and Millville subbasins are described in the CA Groundwater Bulletin 118. Details include annual precipitation, geology, recharge areas, groundwater level trends, and groundwater supply and quality.	x						x	x	x		x					x			
Shasta County General Plan, 2004	The Shasta County General Plan discusses a wide range of topics with some relevant to stormwater management planning. Section 5.1 discusses seismic and geologic hazards, Section 5.2 outlines flood protection measures, and Section 5.3 covers dam failure inundation. Section 6.6 describes water resources including demands and supplies throughout the county and suggested actions to ensure adequate future supply. Section 6.7 outlines threatened, endangered, and special status animals and plants and their habitats within the county and strategies to address key issues to ensure their protection.		x				x					x	x	x				x	x	x

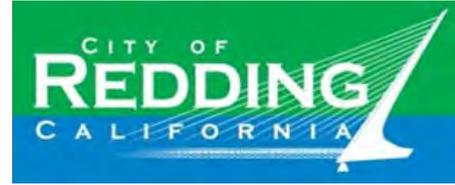

Name of Report	Description	Surface Water/Hydrology						Groundwater/Geology					Agency Details				Other			
		Precipitation and Evapotranspiration	Watershed/Drainage Systems	Stormwater Capture Facilities	Surface Water Quality	Water Quality Limits/Designations	Other Surface Hydrology	Groundwater Level	Groundwater Quality	Groundwater Basins	Wells	Other Groundwater/Aquifer Characteristics	Soil Types/Geology	Population	Jurisdictions	Water Infrastructure	Proposed BMPs	Water Supply	Flood Management	Environmental
Storm Water Quality Improvement Plan, 2003, City of Redding	The Storm Water Quality Improvement Plan outlines water quality improvement priorities and actions needed to meet the Clean Water Act. Climate, population, land use, stormwater infrastructure, and general surface features are described. State of California, school districts, Shasta County, and Union Pacific Railroad are identified as potential partners to help with pollution reduction. Section 4 describes the Sacramento River as the receiving water in the Redding area and includes a discussion of beneficial uses, local streams, and drainage basins within the city.		x	x	x	x	x											x		
Upper Sacramento River TMDL for Cadmium, Copper & Zinc, 2002, Sacramento River TMDL Unit	The TMDL Report identifies strategies to comply with TMDL waste load allocations (WLAs). The Report identifies management and clean up efforts at former mining sites to meet TMDL requirements for cadmium, copper, and zinc.		x		x	x													x	
City of Redding 2000-2020 General Plan	The City of Redding General Plan covers a wide range of topics, but the Natural Resources and Health and Safety Elements are of relevance to stormwater management. The Natural Resource Element describes the municipal water source, issues affecting water quality and supply, and identifies stormwater management and groundwater recharge opportunities in creek and river floodplains. Biological habitats, open space, and mineral, energy, and agricultural resources are discussed as well. The Health and Safety Element discusses and maps hazards stemming from seismic, geologic, flood, dam inundation, fire, crime, and other related sources. Expansive soils and subsidence are not considered to be significant threats.		x				x			x	x	x	x					x	x	x
Draft Enterprise Area Groundwater Study, 1996, CH2M HILL	The Enterprise Area Groundwater Study was conducted to evaluate three options for expanding groundwater production. The geology and hydrogeology of the area are described briefly before the modeling and alternatives are discussed in depth.						x	x	x	x	x				x		x			
City-Wide Master Storm Drain Study Final Report, 1993, City of Redding	The City-Wide Master Storm Drain Study describes a plan for managing stormwater runoff within the city with consideration of future development and expansion. The hydrologic design criteria used to evaluate and plan include land use, effective impervious, Manning's n, depth-duration-frequency precipitation, peak flow, and design storm values applicable to Redding. Various drainage improvement options were considered and preliminary details and cost estimates are provided. This study expanded the areas considered to be within the 100-yr flood zone. The City of Redding Hydrology Manual is included as Appendix C.	x	x				x								x	x		x		x

Name of Report	Description	Surface Water/Hydrology						Groundwater/Geology					Agency Details				Other				
		Precipitation and Evapotranspiration	Watershed/Drainage Systems	Stormwater Capture Facilities	Surface Water Quality	Water Quality Limits/Designations	Other Surface Hydrology	Groundwater Level	Groundwater Quality	Groundwater Basins	Wells	Other Groundwater/Aquifer Characteristics	Soil Types/Geology	Population	Jurisdictions	Water Infrastructure	Proposed BMPs	Water Supply	Flood Management	Environmental	Community
Redding Region Water Supply Alternatives, 1975, CH2M HILL	The Redding Region Water Supply Alternatives report describes the results of the study of 39 alternatives to increase water supply in the Redding area. The existing water supply, treatment, storage, and evaluation of each participating water purveyor is provided. Pages 4-4 through 4-6 provide a summary of, and Appendix B discusses in depth, the condition and supply of groundwater, the geology of the basin, and well systems in place. States that recharge occurs at the edges of the groundwater basin and near some streams.							x			x	x	x	x	x	x		x

## SECTION 1. INTRODUCTION

As part of the City of Redding Stormwater Resource Plan (SWRP), parcels within the City of Redding (the City) were evaluated for structural stormwater BMP implementation opportunities. Structural BMPs considered for SWRP project implementation include green streets, direct use storage tanks, and natural treatment systems which may be either infiltration-based or treatment-based BMPs. This appendix describes the methods used to identify and rank those parcels within the City most suitable for SWRP project implementation.

Identification of parcels most suitable for project implementation is a two-step process involving: 1) project identification, and 2) project ranking. For the first step, parcels within the City are screened in Geographic Information Systems (GIS) to identify parcels, or portions thereof, which meet land use requirements and are free of geographic constraints limiting implementation (outlined in Figure E-1). After these potential project implementation areas (called SRWP projects) are identified, they are compared to one another and ranked to highlight those projects that are most feasibly implemented and have the greatest potential benefits. Details related to the project identification and project ranking processes are discussed in Sections 2 and 3, respectively.

**Figure E-1. Example Project Identification for Infiltration-based BMPs**

## **SECTION 2. PROJECT IDENTIFICATION**

For the first step, parcels throughout the City were evaluated in the GIS environment to identify potential project implementation areas. To do this, the City parcels shapefile was overlain first by a land use shapefile, to screen out those parcels with land uses not conducive to large-scale structural BMP implementation (e.g., residential, commercial). Then, remaining parcels were overlain by various shapefiles representative of geophysical/environmental constraints, such as slope and environmentally sensitive areas, to screen out parcels or portions thereof where BMP implementation is not feasible (e.g. areas of high slope). Those portions of parcels which did not meet land use requirements or were overlain by geographic constraints precluding implementation were then removed from consideration, leaving only “usable areas” for further consideration. A SWRP project is defined as any parcel containing “usable area” of at least 0.25 acres in size.

Implementation feasibility evaluations are BMP-specific (Geosyntec Consultants and LWA, 2011). Projects were therefore subject to three BMP-specific identification processes to evaluate the feasibility of implementing each of the three SWRP project types identified for City of Redding (natural treatment systems, green streets, and direct use storage tanks BMPs). The criteria metrics are generally the same, but the subset of criteria applied is BMP-specific. The general criteria and metrics used to define various constraints are described in Section 2.1 and the BMP-specific identification processes (the subset of metrics applied to each SWRP project type) are discussed in Section 2.2.

### **2.1 Project Identification Criteria**

#### **2.1.1 Land Use**

Potential implementation and use (parcels which might be able to utilize water stored in direct use BMPs) parcels were identified based on designated land use.

Parcels with the following land uses were maintained as potential project implementation areas:

- Agricultural parcels<sup>1</sup>
- Open Space<sup>2</sup>
- Recreation<sup>3</sup>

---

<sup>1</sup> Based on parcels that overlap agricultural land use designations in the 2005 Shasta County land survey by the California Department of Water Resources (CA DWR).

<sup>2</sup> Based on parcels that overlap the following land use designations in the 2005 Shasta County, CA DWR land survey: native vegetation, riparian vegetation, barren and wasteland; and those designated as open space in the City parcel file received from the City on 12/19/2017.

<sup>3</sup> Based on the following land use designations in the City parcel file: golf courses and parks.

- Rights of way<sup>4</sup>
- Schools<sup>5</sup>
- Vacant or undeveloped<sup>6</sup>

Parcels with the following land uses were also identified as potential use areas. Proximity to direct use BMP implementation sites is considered later in the identification process (see Section 2.1.2).

- Golf courses
- Parks
- Schools

### **2.1.2 Geophysical and Environmental Constraints**

Following the land use analysis, remaining parcels were overlain by the shapefiles representative of various geophysical and environmental constraints. As noted above, the metrics used to evaluate BMP implementation feasibility are generally the same across SWRP project types, but the subset of constraints applied is BMP-specific. Table E-1 shows the entire list of geophysical and environmental constraints considered, the metrics used to measure them, and the BMP-specific SWRP project type to which each constraint applies. The sources for the files used in the project identification are shown in Table E-2.

---

<sup>4</sup> Based on the public land use designation in the City parcel file.

<sup>5</sup> Based on City parcels containing point locations of elementary through college level schools. Point locations of schools downloaded from the County of Shasta GIS website on 12/6/2017.

<sup>6</sup> Based on parcels that overlap with urban vacant land use designation in the 2005 Shasta County, CA DWR land survey and designated as undeveloped land uses in the City parcel file.

**Table E-1. Geophysical and Environmental Constraints Use to Identify Projects**

## 2.2 Project Identification Summary

The unique project identification process was executed for each of the three BMP types described by the criteria in Table E-1. The number of SWRP projects remaining after the identification process for each SWRP project type are shown in Table E-3.

**Table E-3. Identified SWRP projects by type**

<b>Number of Potential SWRP Projects Identified</b>			
<b>Natural Treatment System</b>	<b>Green Street</b>	<b>Direct Use</b>	<b>Total Projects</b>
1,125	3,926	638	5,689

## **SECTION 3. PROJECT RANKING**

Potential projects remaining after the identification process (i.e., SWRP projects) were then ranked based on scores resulting from two additional phases of analysis. The first phase involved a GIS analysis where projects were assigned scores based on the degree to which various conditions (e.g., imperviousness, slope, etc.) make implementation feasible or infeasible. The second phase involved an individualized desktop analysis of the project and its drainage area, where projects were assigned scores based on both the relative size and impairment of their drainage areas (LPR] Model Catchment Prioritization Index [CPI], trash priorities) and a general assessment of BMP implementability. Scores resulting from these two phases of analysis were then combined for each potential project and ranked to identify those projects most suitable for SWRP implementation. Details related to the two phases of project ranking and the process by which scores are combined are discussed in the following sections.

### **3.1 Phase I: Project Condition Evaluation**

For the Phase I evaluation, the SWRP projects were assigned scores based on the degree to which they met certain conditions to facilitate BMP implementation (e.g., ownership, distance to flow source, size of usable area). For comparison purposes, the range of results for each condition were adjusted to numeric scores ranging from 0 to 3. For all conditions, low implementation favorability was represented by a score of 0 and high implementation favorability was represented by a score of 3. The conditions used to evaluate the potential projects are summarized in Table E-4, however, the conditions evaluated are specific to each SWRP project type, so each SWRP project was not evaluated for all conditions. shown in Table E-4. The sources for all GIS data files used in the Phase I ranking process are shown in Table E-5.

**Table E-4. Phase I Project Condition Scoring**

Condition of Usable Area	Classification Definition		Condition Score
	Classification or Low Range (if applicable)	High Range (if applicable)	
Imperviousness (%)	0%	25%	3
	25%	50%	2
	50%	75%	1
	75%	100%	0
Slope (%)	0%	2%	3
	2%	4%	2
	4%	8%	1
	8%	10%	0
Parcel Ownership	City of Redding		3
	Public		2
	McConnell Foundation		2
	Private		1
Onsite Septic System	No Septic		3
	Septic		0
Soil Infiltration (hydrologic soil group)	A		3
	B		2
	C		1
	D		0
Distance from planned subdivision (miles)	Project within subdivision		3
	>0	0.25	2
	0.25	1	1
	1	no limit	0
Distance from Source (ft)	0	100	3
	100	200	2
	200	350	1
	350	500	0
Size of Storm Drain (inch)	42	no limit	3
	32	42	2
	18	32	1
	0	18	0
Street Type	Arterial		3
	Collector		2
	Local		0
Street Ownership	City of Redding		3
	Public		1
Size of Usable Area (acres)	2	no limit	3
	1	2	2
	0.5	1	1
	0	0.5	0
Length of Usable Street (ft)	600	no limit	3
	300	600	1
	0	300	0

**Table E-5. Data Sources for Phase I Project Condition GIS Files**

<b>File</b>	<b>Source</b>	<b>Date Received or Downloaded</b>
Imperviousness	National Land Cover Database Imperviousness (2011), Multi-Resolution Land Characteristics (MRLC) Consortium	9/14/2017
Slope	Created from the topographic Digital Elevation Model (DEM) received from the City of Redding	12/19/2017
Project Parcel Ownership	Determined based on the parcel file provided by the City of Redding	12/19/2017
Project Street Ownership	Determined based on the road centerline file downloaded from the City of Redding	12/7/2017
Onsite Septic System	City of Redding	12/19/2017
Soils (hydrologic soil groups)	U.S. Department of Agriculture (USDA) National Resources Conservation Service (NRCS) Web Soil Survey	8/16/2017
Distance from source, size of storm drain	City of Redding	12/19/2017

Scores for each project condition were then weighted based on the priority of each condition to implementation of the various SWRP project types. The weights used to adjust scores for each parcel for each SWRP project type are shown in Table E-6.

**Table E-6. Phase I Project Condition Weighting**

<b>Condition for Usable Area</b>	<b>Project Condition Weight<sup>a</sup></b>		
	<b>Natural Treatment System</b>	<b>Green Street</b>	<b>Direct Use</b>
Imperviousness	5%		10%
Slope	5%	10%	10%
Parcel/Street Ownership	20%	20%	10%
Onsite Septic System	10%		
Soil Infiltration (hydrologic soil group)	20%	20%	
Distance from Planned Subdivision	10%	20%	20%
Distance from Source	10%		20%
Size of Storm Drain	10%		20%
Size of Usable Area or Length of Street	10%	10%	10%
Street Type		20%	

a. Condition weights left blank were not evaluated for the project type

Weighted scores for each applicable condition were then summed for each potential implementation area, resulting in the Phase I scores ranging from 0 to 3, for each SWRP project type, that allow for SWRP projects to be ranked. The Phase I scores for every identified SWRP project are included in Attachment E-1 by project type.

### **3.2 Phase II: Drainage Area and General Feasibility Evaluation**

The main objectives of the Phase II evaluation were to assess the relative potential benefits from capturing and using (i.e., infiltrating, using as non-potable water supply, or treating and discharging) the runoff from the project drainage areas, and to identify any major barriers to BMP implementation not already addressed (e.g., major trees, utilities) for the top ranked projects from the Phase I evaluation and all the potential projects recommended by the City, the technical advisory committee (TAC), and the stakeholders. A total of 76 projects were evaluated during Phase II, including 18 NTS, 14 stream/lake restoration, 5 direct use, and 39 green street projects. And an adaptive framework was established to easily<sup>7</sup> evaluate additional potential project locations using this Phase II methodology and include them on the ranked list at any point in the future.

Relative benefits for stormwater capture and use were assessed by looking at the results of previous studies including catchment prioritization scores, which provide information regarding the relative magnitude of stormwater pollutant loads in the drainage area from the City of Redding LPR Model (Geosyntec, 2017), as well as the percentage of trash priority land uses within each drainage area to comply with the California Trash Amendments (SWRCB, 2017). General feasibility was assessed through an aerial imagery analysis to identify barriers to implementation such as trees, large amounts of impervious surfaces, utilities, access, and general configuration.

Similar to the Phase I evaluation, the range of values for each metric were scaled to numeric scores ranging from 0 to 3, where scores of 0 reflect lesser implementation feasibility/benefit and scores of 3 reflect greater implementation feasibility/benefit. The attributes evaluated and associated value scores for the drainage area and general feasibility evaluation are shown in Table E-7. No projects were identified as having a “fatal flaw” (i.e. drainage area less than 10 acres (unless explicitly requested); trees covering more than 90% of usable area; structures, utilities, or other permanent features covering usable area), so none were removed from consideration. As with the Phase I scores, the drainage area and general feasibility scores were weighted based on priority. A single weight factor was used for each attribute regardless of SWRP project type (Table E-7). Weighted scores for each attribute were then summed for each SWRP project, resulting in the

---

<sup>7</sup> A format Microsoft Excel file has been included with the project files that includes: directions for evaluating the potential project locations, formulas for assigning weights and scores based on the desktop evaluation, and a filterable list of evaluation results and rankings. A KMZ file has also been included that shows all the spatial layers necessary for performing the desktop evaluation.

Phase II scores ranging from 0 to 3 (for each SWRP project type) that allow SWRP projects to be ranked. The scores for all the SWRP projects evaluated in Phase II are included in Attachment E-2 by project type.

**Table E-7. Phase II Project Metric Scoring and Weights**

Metric for Usable Area	Category Definition	Metric Point	Metric Weight	
Approximate Size of Drainage Area and % Urban Land Use	Extra-large (>5,000 acres)	3	25%	
	Large (1,000 – 5,000 acres)	>50% Urban		3
		10-50% Urban		2
		<10% Urban		1
	Medium (50 – 1,000 acres)	>75% Urban		3

<sup>a</sup> U.S. Department of Housing and Urban Development (HUD) qualified census tracts <sup>b</sup> U.S. Economic Development Administration (EDA) qualified census tracts <sup>c</sup> Issues examined for BMP implementability include large trees/vegetation in usable area, high amount of impervious surface (i.e., parking lots or large structures), presence of powerlines/utilities, difficult or nonexistent path for transporting water from the source to the parcel, and configuration of usable area.				

### 3.3 Final SWRP Project Ranks

To combine scores resulting from the project conditions (Phase I) and drainage area and general feasibility (Phase II) evaluations, the scores from the two phases were averaged to determine an overall ranking score for each project ranging from 0 to 3. The overall scores for all the SWRP project evaluated in Phase II are included in Attachment E-2 by project type. Additionally, KMZ files were created for spatial viewing in Google Earth for each Phase I and Phase II project and color coded based on their ranking (example shown in Figure E-2).

Figure E-2. Redding SWRP Projects KMZ file

## **SECTION 4. CONCLUSION**

The SWRP project identification and ranking process was conducted in conjunction with the City, TAC, and Stakeholders. The City, TAC, and stakeholders were consulted for input with respect to weighting regimes and were provided results for each phase of the analysis. At completion, the City, TAC, and stakeholders were provided and asked to review detailed results for all potential SWRP projects, which included comments relating to BMP implementability (for those subject to the drainage area and general feasibility evaluation). The final list of identified and ranked potential SWRP projects will act as a crucial initial foundation for the planning of future stormwater capture and use projects in the years to come. By using this adaptive methodology that allows for future evaluation and addition of potential projects locations, the City has created a framework to expand the comprehensiveness of the desktop evaluated and ranked potential project list.

**LISTS OF PHASE II PROJECT RANKINGS BY SWRP PROJECT TYPE**

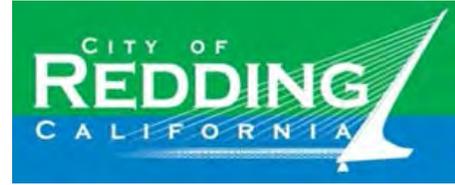

**Table E-11  
Ranked Natural Treatment and Direct Use Projects (Phase II)**

APN	Project Type	Project ID	Recommended by TAC/ Stakeholders	Observation								Prioritization Score							
				Drainage Area Size and % Urban	LPR Model CPI	Trash Priority Land Use	Project Benefits EDA	Infiltration Potential (Majority A or B soils in project area)	Liquefaction Potential if Infiltration is Possible	Implement-ability	Comments	Drainage Area Size and % Urban	LPR Model CPI	Trash Priority Land Use	Project Benefits EDA	Implement-ability	Weighted Phase II Score	Weighted Phase I Score	Average Score
11707008000	Direct Use	DU-1		Medium (>75%)	3	>50%	100% HUD			No issues	Open park at upper end of Little Churn Creek channel, smaller drainage and <25% trash if not pulling from channel	3	2	3	3	2	2.6	2.7	2.7
11715002000	Direct Use	DU-5		Medium (25-75%)	3	25-50%	100% HUD			Some issues	Heavy tree cover	2	2	2	3	1	2.0	2.6	2.3
56010025000	Direct Use	DU-4		Medium (25-75%)	2	0-25%	50-100% in HUD or 100% EDA			No issues	Part of Redding Airport	2	1	1	2	2	1.8	2.7	2.3
54280005000	Direct Use	DU-3		Medium (25-75%)	3	0-25%	50-100% in HUD or 100% EDA			Some issues	Part of Redding Airport, about 1/2 of area is paved	2	2	1	2	1	1.6	2.7	2.2
54090039000	Direct Use	DU-2		Small (>75%)	2	0%	<50% in HUD or EDA			No issues	Near residential area in Churn Creek watershed	2	1	0	0	2	1.2	2.7	2.0
204330030000	Lake Restoration	Redding-Mary-Lake	Yes	Medium (>75%)	3	0	<50% in HUD or EDA			No issues	Was originally eliminated since it includes a water body and all land within 300ft of it	3	2	0	0	2	1.6		1.6
109090016000	NTS - Infiltration	NTS-5		Medium (25-75%)	3	0-25%	50-100% EDA	Yes		No issues	Open space adjacent to Churn Creek	2	2	1	1	2	1.7	2.6	2.1
104500036000	NTS - Infiltration	NTS-4		Small (25-75%)	2	0%	<50% in HUD or EDA	Yes		Some issues	about 1 acre area in northern end of parcel, rest is covered in trees or was removed	1	1	0	0	1	0.7	2.6	1.6
101490011000	NTS - Treatment	SHHSA-Trail	Yes	Medium (>75%)	3	25-50%	50-100% in HUD or 100% EDA	Yes	High	Additional Benefits	Adjacent to Sacramento River, natural open space - easy to implement, park-like location has high potential for community benefits	3	2	2	2	3	2.6	2.8	2.7
117070028000	NTS - Treatment	Redding-Sewer-Ponds	Yes	Large (>50%)	4	25-50%	50-100% in HUD or 100% EDA			Additional Benefits	All public parcels along once side of channel, existing infrastructure could be repurposed	3	2	2	2	3	2.6	2.1	2.3
116180006000	NTS - Treatment	Redding-Sewer-Ponds	Yes	Large (>50%)	4	25-50%	50-100% in HUD or 100% EDA			Additional Benefits	All public parcels along once side of channel, existing infrastructure could be repurposed	3	2	2	2	3	2.6	1.9	2.2
101790044000	NTS - Treatment	Redding-Mall	Yes	Small (>75%)	5	>50%	100% HUD			No issues	considering parking and walking areas within the mall	2	3	3	3	2	2.5		2.5
101790034000	NTS - Treatment	Redding-Mall	Yes	Small (>75%)	5	>50%	100% HUD			No issues	considering parking and walking areas within the mall	2	3	3	3	2	2.5	2.1	2.3
101790043000	NTS - Treatment	Redding-Mall	Yes	Small (>75%)	5	>50%	100% HUD			No issues	considering parking and walking areas within the mall	2	3	3	3	2	2.5	1.6	2.0
68050031000	NTS - Treatment	Redding-Trash-1	Yes	Large (>50%)	4	>50%	50-100% in HUD or 100% EDA			Some issues	Church owns parcels, more open space than option #2	3	2	3	2	1	2.1		2.1
67190028000	NTS - Treatment	Redding-Trash-2	Yes	Large (>50%)	4	>50%	50-100% in HUD or 100% EDA			Some issues	Privately owned mobile home parcels border creek, not much available footprint	3	2	3	2	1	2.1		2.1
068290004000, 068330013000, 068280005000, 068280004000, 068590015000	NTS - Treatment	Redding-Enterprise-Park	Yes	Extra large	3	0-25%	50-100% EDA			Additional Benefits \Some issues	Most of park is within combined floodplain, park location has high potential for community benefits	3	2	1	1	2	1.9		1.9
112140006000	NTS - Treatment	Redding-Caldwell-Park	Yes	Medium (25-75%)	4	0-25%	50-100% in HUD or 100% EDA	Yes	High	Additional Benefits \Some issues	pulling from two locations (3 storm drains ID 10125, 10126, 8223), some trees, adjacent to Sacramento River, park location has high potential for community benefits	2	2	1	2	2	1.9	2.6	2.2
56610008000	NTS - Treatment	NTS-1		Small (25-75%)	2	25-50%	50-100% in HUD or 100% EDA			No issues	Near airport, some trees, >74% grassy	1	1	2	2	2	1.7	2.6	2.1
50330025000	NTS - Treatment	Redding-Allens-Golf	Yes	Medium (25-75%)	3	0-25%	50-100% EDA			No issues	Assuming pulling from Olney Creek as described	2	2	1	1	2	1.7	1.6	1.6
112140007000	NTS - Treatment	NTS-2		Medium (25-75%)	2	0-25%	<50% in HUD or EDA	Yes	High	Some issues	Adjacent to Sacramento River, many trees	2	1	1	0	1	1.0	2.6	1.8
50500029000	NTS - Treatment	NTS-3		Medium (25-75%)	2	0-25%	<50% in HUD or EDA	Yes	High	Some issues	about 1-2 acres of grassy usable area, rest heavy trees. Contains 4 SDs emptying into Olney Creek	2	1	1	0	1	1.0	2.6	1.8
112140001000	NTS - Treatment	NTS-6		Medium (25-75%)	2	0-25%	<50% in HUD or EDA	Yes	High	Some issues	Existing golf course, some trees/infrastructure to work around	2	1	1	0	1	1.0	2.6	1.8
73180062000	NTS - Treatment	Redding-Hollow	Yes	Medium (25-75%)	2	0	<50% in HUD or EDA			Some issues	Within combined floodplain	2	1	0	0	1	0.9		0.9
107500012000	Stream Restoration - Infiltration	Redding-Henderson	Yes	Medium (>75%)	0	>50%	50-100% in HUD or 100% EDA	Yes	High	Some issues	Within combined floodplain, heavy tree cover	3	0	3	2	1	1.9		1.9
050660018000, 050640027000, 050600051000	Stream Restoration - Infiltration	Redding-Olney-Creek	Yes	Extra large	2	0-25%	<50% in HUD or EDA	Yes	High	Some issues	heavily vegetated	3	1	1	0	1	1.3		1.3
50370041000	Stream Restoration - Infiltration	Redding-Olney-Creek	Yes	Extra large	2	0-25%	<50% in HUD or EDA	Yes	High	Some issues	heavily vegetated	3	1	1	0	1	1.3	2.3	1.8
50600045000	Stream Restoration - Infiltration	Redding-Olney-Creek	Yes	Extra large	2	0-25%	<50% in HUD or EDA	Yes	High	Some issues	heavily vegetated	3	1	1	0	1	1.3	2.3	1.8
203200005000, 203200006000, private: 049010014000, 049010005000, 049010013000, 049020034000, 049010006000	Stream Restoration - Infiltration	SEA-Oregon-Gulch	Yes	Medium (<25%)	2	0	<50% in HUD or EDA	Yes		No issues	3 parcels owned by Redding with no issues, rest are private	1	1	0	0	2	1.0		1.0
203190024000	Stream Restoration - Infiltration	SEA-Oregon-Gulch	Yes	Medium (<25%)	2	0	<50% in HUD or EDA	Yes		No issues	2 parcels owned by Redding with no issues, rest are private	1	1	0	0	2	1.0	1.2	1.1
104500021000	Stream Restoration - Infiltration	Redding-Canyon-Hollow	Yes	Large (10-50%)	2	0	<50% in HUD or EDA	Yes		Some issues	The 2 parcels which include the path and most of the stream are privately owned	2	1	0	0	1	0.9		0.9
108280014000	Stream Restoration - Infiltration	Redding-Canyon-Hollow	Yes	Large (10-50%)	2	0	<50% in HUD or EDA	Yes		Some issues	The 2 parcels which include the path and most of the stream are privately owned	2	1	0	0	1	0.9	2.1	1.5
108480027000	Stream Restoration - Infiltration	Redding-Canyon-Hollow	Yes	Large (10-50%)	2	0	<50% in HUD or EDA	Yes		Some issues	The 2 parcels which include the path and most of the stream are privately owned	2	1	0	0	1	0.9	1.6	1.3
108480005000	Stream Restoration - Infiltration	Redding-Canyon-Hollow	Yes	Large (10-50%)	2	0	<50% in HUD or EDA	Yes		Some issues	The 2 parcels which include the path and most of the stream are privately owned	2	1	0	0	1	0.9	1.4	1.2
101330018000	Stream Restoration - Treatment	Redding-Callaboose-Creek	Yes	Medium (>75%)	3	25-50%	100% HUD			No issues	All public parcels along once side of channel	3	2	2	3	2	2.5	2.1	2.3
101330019000	Stream Restoration - Treatment	Redding-Callaboose-Creek	Yes	Medium (>75%)	3	25-50%	100% HUD			No issues	All public parcels along once side of channel	3	2	2	3	2	2.5	2.0	2.3
101780056000	Stream Restoration - Treatment	Redding-Callaboose-Creek	Yes	Medium (>75%)	3	25-50%	100% HUD			No issues	All public parcels along once side of channel	3	2	2	3	2	2.5	1.8	2.1

**Table E-12  
Ranked Green Street Projects (Phase II)**

Unique ID	Street Name	Project ID	Treatment or Infiltration Design	Recommended by TAC/ Stakeholders	Observation								Prioritization Score							
					Drainage Area Size and % Urban	LPR Model CPI	Trash Priority Land Use	Project Benefits EDA	Infiltration Potential (Majority A or B soils in project area)	Liquefaction Potential if Infiltration is Possible	Implementability	Comments	Drainage Area Size and % Urban	LPR Model CPI	Trash Priority Land Use	Project Benefits EDA	Implementability	Weighted Phase II Score	Weighted Phase I Score	Average Phase I and II Score
39	MARKET ST	Redding-Mall	Treatment	Yes	Small (>75%)	5	>50%	100% HUD			Additional Benefits	Mall location has high potential for community benefits	2	3	3	3	3	2.8		2.8

## **SECTION 1. INTRODUCTION**

Various project opportunities for stormwater and dry weather capture were identified in the City of Redding (City) that meet one or more of the criteria established for project selection included in the Water Code and the SWRP Guidelines (Guidelines) (SWRCB, 2015). These identified projects were then evaluated by the condition of the parcel, the potential benefits of the project, and barriers to implementation to establish a ranked list of projects for each BMP type. The City reviews the ranked projects and the Technical Advisory Committee (TAC) and stakeholders identify projects for conceptual development. These projects are then conceptually designed, and project benefits (water quality, water supply, flood management, and environmental) are quantified as required by the Water Code and Guidelines. These multiple benefits are then used to prioritize the conceptual projects. This document outlines the development of conceptual designs for selected projects, the procedures and assumptions used to quantify anticipated benefits from proposed projects, and the methods used to prioritize the projects.

## **SECTION 2. DEVELOPMENT OF CONCEPTUAL PROJECT DESIGNS**

The project identification and ranking process was executed for each of the SWRP project types (natural treatment systems, green streets, and direct use), as described in Appendix E. Projects selected for the development of conceptual designs require delineating the upstream drainage area and determining appropriate conceptual design parameters. These processes, including the necessary spatial files, are described in the following subsections.

### **2.1 Spatial Data**

Conceptual designs are developed largely in Geographic Information Systems (GIS) based on the spatial data listed in Table F-1. Descriptions of how these spatial files are used in project drainage area delineation and conceptual design are included in Sections 2.2 and 2.3, respectively.

**Table F-1. Spatial Datasets to be Used for Developing Conceptual Designs**

<b>Task</b>	<b>Dataset Description</b>	<b>Dataset Format</b>	<b>Source</b>	<b>Downloaded/Received</b>

<sup>1</sup> Developed using files noted for the drainage area delineation task.

## **2.2 Drainage Area Delineation**

A spatial file containing the area draining to the proposed project location is developed using waterbody and storm drain spatial files and elevation data. Elevations are based on both a three-foot Lidar-generated DEM and elevation information in Google Earth. Where available, MS4 catchment and outfall data are also utilized in delineation of the project drainage area.

The imperviousness of the drainage area to the project, which describes the portion of the drainage area where runoff is not able to infiltrate, is needed for the conceptual design process (to be discussed in Section 2.3). To calculate this, the average across the drainage area is calculated using the National Land Cover Database (NLCD) 2011 percent developed imperviousness raster.

### 2.3 Conceptual Design Parameters

General design parameters were determined for each SWRP project type based on guidance from the Ventura County Technical Guidance Manual (TGM) (Geosyntec Consultants and LWA, 2011). While many design parameters are BMP-specific, the calculation of the stormwater quality design volume (SQDV) is necessary for all SWRP project types. The SQDV is used to determine the size of a BMP to provide effective treatment for the specified drainage area. The SQDV is determined for each project using the Urban Runoff Quality Management (URQM) (WEF Manual of Practice No. 23/ASCE Manual of Practice No. 87) approach. This method estimates the maximized stormwater quality captured volume based on the translation of rainfall to runoff using regression equations and approximately corresponds to the 85<sup>th</sup> percentile, 24-hour runoff event. The size and runoff coefficient of the drainage area is used as project-specific inputs<sup>1</sup> for this calculation.

Using the SQDV as the design storage capacity and other BMP-specific design parameters, conceptual designs characterizing project footprints, depths, and side slopes, are developed for each project. Parcels are then evaluated through aerial imagery analysis to identify constraints that might limit BMP implementation, such as heavy vegetation/trees, high slopes, utilities, buildings, existing uses such as sports fields, and to determine whether the useable area onsite could accommodate the BMP footprint calculated for the area draining to it. Files and investigations from the project identification and ranking process, as described in Appendix E, are utilized to aid in determining the maximum available area for implementation of each BMP.

For those conceptual projects without adequate space, the BMP is sized instead based on the maximum usable area of the parcel in order to capture and infiltrate, treat, or use the largest amount of stormwater and dry weather runoff volume feasible. For those conceptual projects with adequate space to accommodate the SQDV, the parcel is further evaluated to determine if it is cost effective

#### PROJECT TYPES WITH DESIGN PARAMETERS

- infiltration basin
- natural treatment systems
- bioretention/rain garden
- green streets (porous pavement)
- direct use

---

<sup>1</sup> Other inputs for calculation of the SQDV include the average storm event precipitation depth, which is assumed to be 0.55 inches for all projects. The representative runoff coefficient is determined by the soil type and imperviousness of the drainage area (Geosyntec Consultants and LWA, 2011). Regression equations include regression constants from the least-square analysis based on a 12, 24, or 48 hour drawdown time (WEF and ASCE, 1998). For purposes of this calculation, the volume capture ratio coefficients are used and a 48 hour drawdown time is assumed for all projects. These values may vary from the drawdown times used for other components of conceptual design due to availability of data using the regression constants.

to expand the footprint and provide storage capacity larger than the SQDV. If there are no site limitations, including even minor constraints such as moderate vegetation/trees, moderate slopes, paved areas, or other existing site uses such as developed parks, the footprint is expanded to the usable area with no site limitations in order to maximize the stormwater and dry weather runoff volume that could be captured. If constraints are noted that could make the BMP feasibility more difficult, such as moderate slopes, then expanding the footprint would not be cost-effective. The following subsections outline basic conceptual design parameters for the SWRP project types (see Sidebar). Conceptual design parameters for the SWRP conceptual projects, including the delineated drainage area information, are included in Appendix G.

### **2.3.1 Infiltration Basins**

An infiltration basin consists of a flat-bottomed earthen basin constructed in naturally pervious soils (hydrologic soil groups A or B) and typically includes an inlet structure to dissipate the energy of incoming flow and an emergency spillway to control excess flows. A forebay settling basin or separate treatment control measure must be provided as pretreatment. An infiltration basin functions by retaining the SQDV in the basin and allowing the retained runoff to percolate into the underlying soils over a specified period of time. The bottoms of infiltration basins are typically vegetated with dry-land grasses or irrigated turf grass.

Infiltration basins can be implemented in various land uses, including mixed-use and commercial, roads and parking lots, parks and open space, and single and multi-family residential. Routine maintenance for infiltration basins includes removal of trash, debris, and sediment at inlet and outlets, inspection during wet weather to ensure drain time, weed removal, and inspection for mosquito breeding (Geosyntec Consultants and LWA, 2011).

For the SWRP, infiltration basins are conceptually designed based on the TGM parameters listed below. A conceptual schematic of an infiltration basin is shown in Figure F-1.

- Pretreatment: assume to occupy 25 percent of the available area
- Drawdown time: 48 hours (limited for vector control purposes)
- Infiltration rate: Based on the site-specific hydrologic soil group (1.5 in/hr for hydrologic soil group A (NRCS, 2007))
- Footprint Area: Determined based on space available for the BMP or the footprint needed to store the SQDV (as described in Section 2.3)
- Depth: Governed by the drawdown time and infiltration rate (6 ft for hydrologic soil group A)
- Side slope: 3:1
- Freeboard Depth: 1 ft

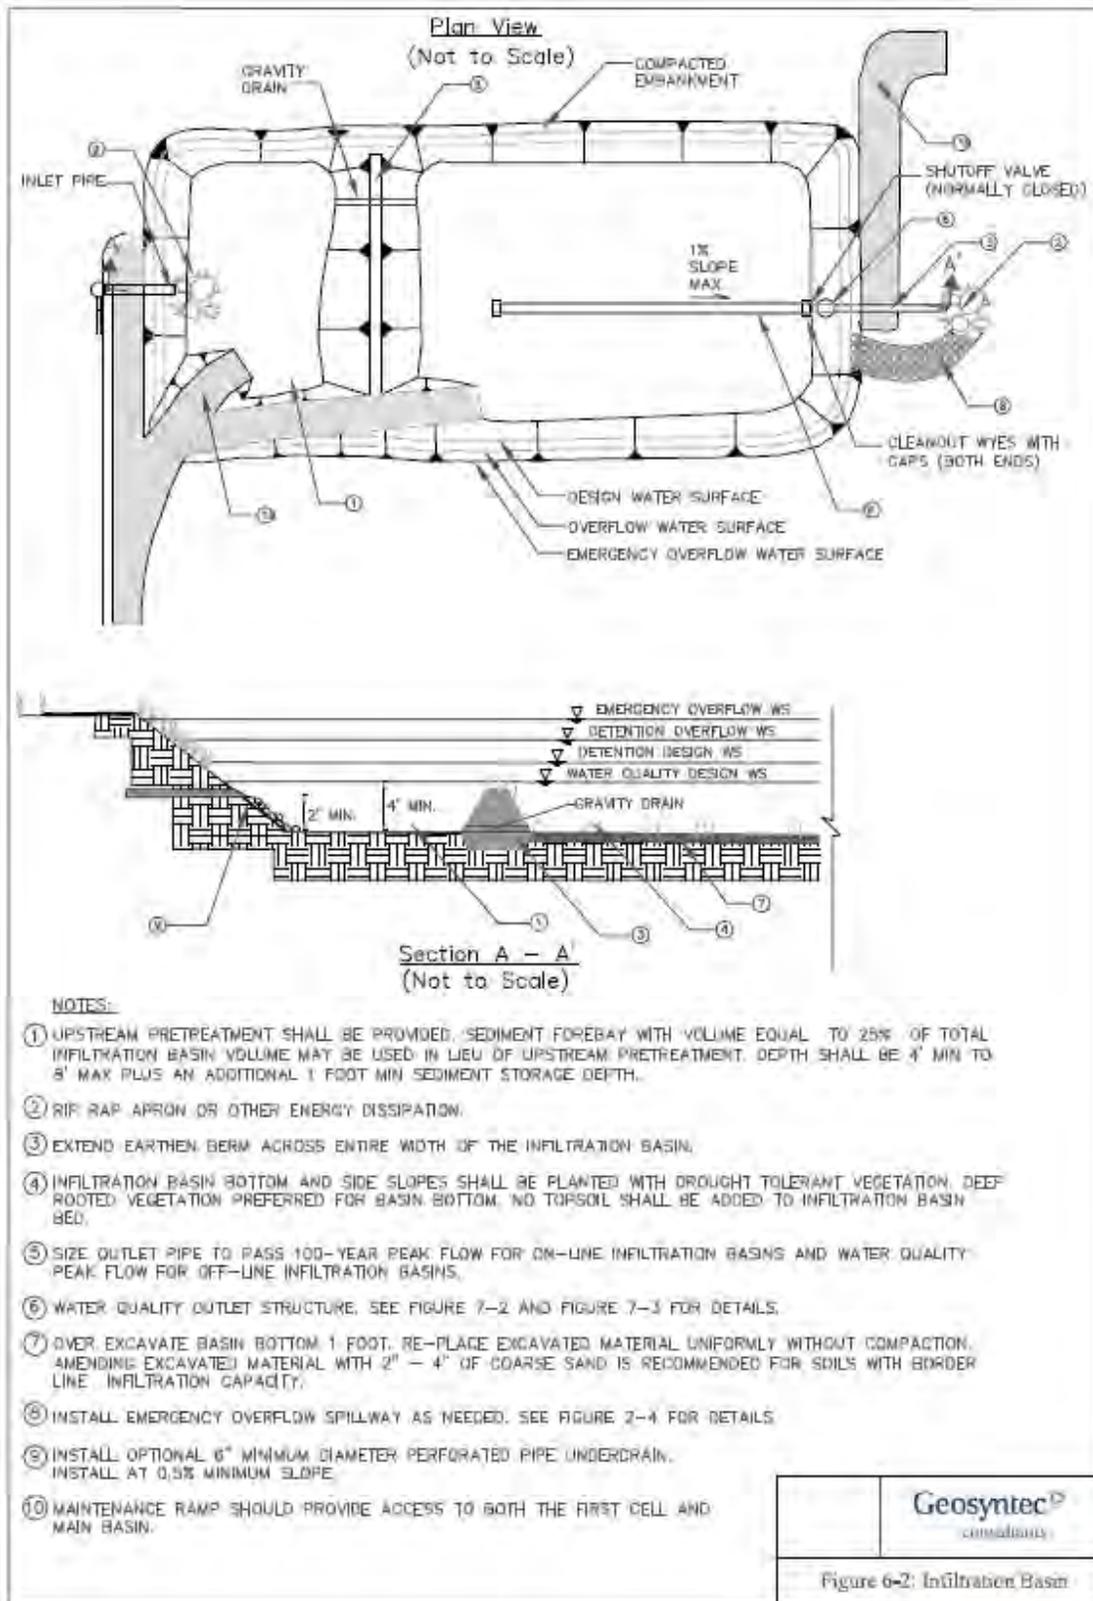

Figure F-1. Infiltration Basin Schematic

### 2.3.2 Natural Treatment Systems

Natural Treatments Systems represent a variety of stormwater treatment types, including constructed wetlands, wet detention basins, and bioinfiltration. The design guidance included here is for a wet detention basin, although based on findings from initial feasibility investigations project type or design may be modified.

Wet detention basins typically require base flows to exceed or match losses through evaporation and infiltration, and they are designed to maintain a permanent pool or seasonal pool of water. However, the SWRP projects also include infiltration capacity by allowing retained runoff to percolate into the underlying soils. They provide peak flow attenuation and pollutant removal, predominately through sedimentation, similar to dry basins. Extended detention of incoming flows is provided by utilizing the volume above the permanent pool surface.

Wet detention basins can be used for regional detention and treatment or smaller applications in parking lots, roads, or commercial/residential areas. Maintenance includes inspection annually (at a minimum) and after major storm events, pruning/removal of vegetation, large shrubs, or trees that interfere with operation, and removal of sediment buildup at inlets and outlets (Geosyntec Consultants and LWA, 2011).

Wet detention basins serve as the basis for design of the natural treatment systems and lake/pond restoration. The projects are conceptually designed based on the TGM parameters for wet detention basins listed below. A conceptual schematic is shown in Figure F-2.

- Active volume area: determined based on space available for the BMP – area of the berm
- Berm top width: 12 ft or 6 ft (TGM recommends at least 6 ft)
- Active volume: design volume plus an additional 5% for sediment accumulation
- Forebay volume: 10% of active volume
- Forebay depth: 8 ft or 4 ft based on available depth while maintaining gravity-driven flow (TGM recommends 4 – 8 ft)
- Minimum wetpool area: cell 2 volume (active volume – forebay volume) x 0.3 acre/acre-ft
- Actual wetpool area: active volume area – forebay area
- Emergent vegetation area: 45% of wetpool area
- Depth (vegetated area): 2 ft (TGM recommends 1.5 – 3 ft)
- Deeper volume surface area: wetpool area – shallow (vegetated) area
- Depth (deeper zone) (average of deeper zone volume): 3.8 – 4.4 ft (TGM recommends 4 – 8 feet average)
- Maximum residence time: 7 days
- Freeboard: 1 ft
- Side slope: 4:1 (interior) and 3:1 (exterior)

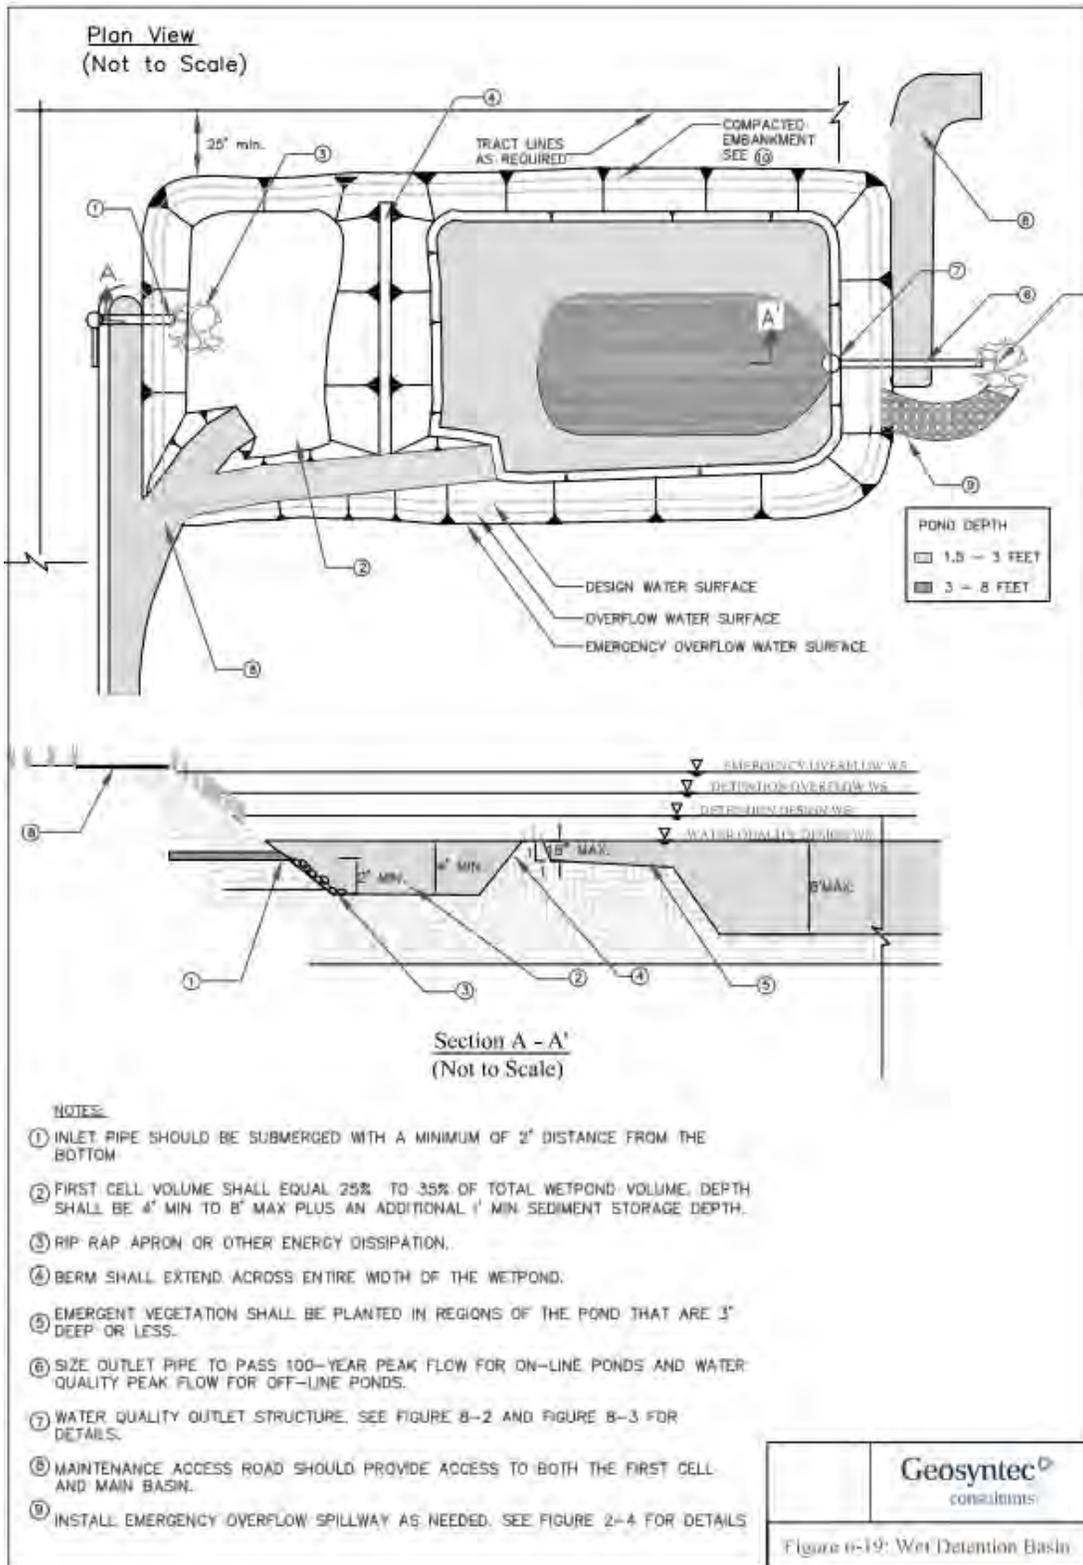

Figure F-2. Wet Detention Basin Conceptual Design Schematic

### 2.3.3 Bioretention with Underdrains

Bioretention stormwater treatment facilities are landscaped shallow depressions that capture and filter stormwater runoff. These facilities function as a soil and plant-based filtration device that removes pollutants through a variety of physical, biological, and chemical treatment processes. The facilities normally consist of a ponding area, mulch layer, planting soils, and plantings. As stormwater passes down through the planting soil, pollutants are filtered, adsorbed, and biodegraded by the soil and plants. An underdrain may be used in areas with low soil permeability, steep slopes, or shallow groundwater.

Bioretention facilities with underdrains are often utilized in parking lots, roadway parkways and medians, school entrances, courtyards, and walkways, playgrounds and sports field, etc. Maintenance includes repair of eroded surfaces, removal of trash and debris, raking of surface soils, removal of accumulated fine sediments, dead leaves, weeds, and trash, pruning back excess growth, removal of sediment and debris accumulation near inlet and outlets, and periodic observation of function during wet weather (Geosyntec Consultants and LWA, 2011).

Bioretention with underdrains are conceptually designed based on the plans for the Mall Alley green street project supplied by the City. Design parameters are listed below and conceptual schematic is shown in Figure F-3.

- Pretreatment: assumed to occupy 25 percent of the available area
- Maximum drawdown time of water ponded on surface: 72 hours
- Footprint Area: Determined based on space available for the BMP or the footprint needed to store the SQDV (as described in Section 2.3)
- Ponding depth: 4 inches
- Stabilized mulch depth: 1 inches
- Planting mix depth: 7 inches
- Gravel layer depth: 16 inches
- Mulch porosity: 0.4
- Planting mix porosity: 0.3
- Gravel layer porosity: 0.35
- Infiltration rate: Based on the site-specific hydrologic soil group (0.32 in/hr for hydrologic soil group C (NRCS, 2007))
- Side slope: 3:1

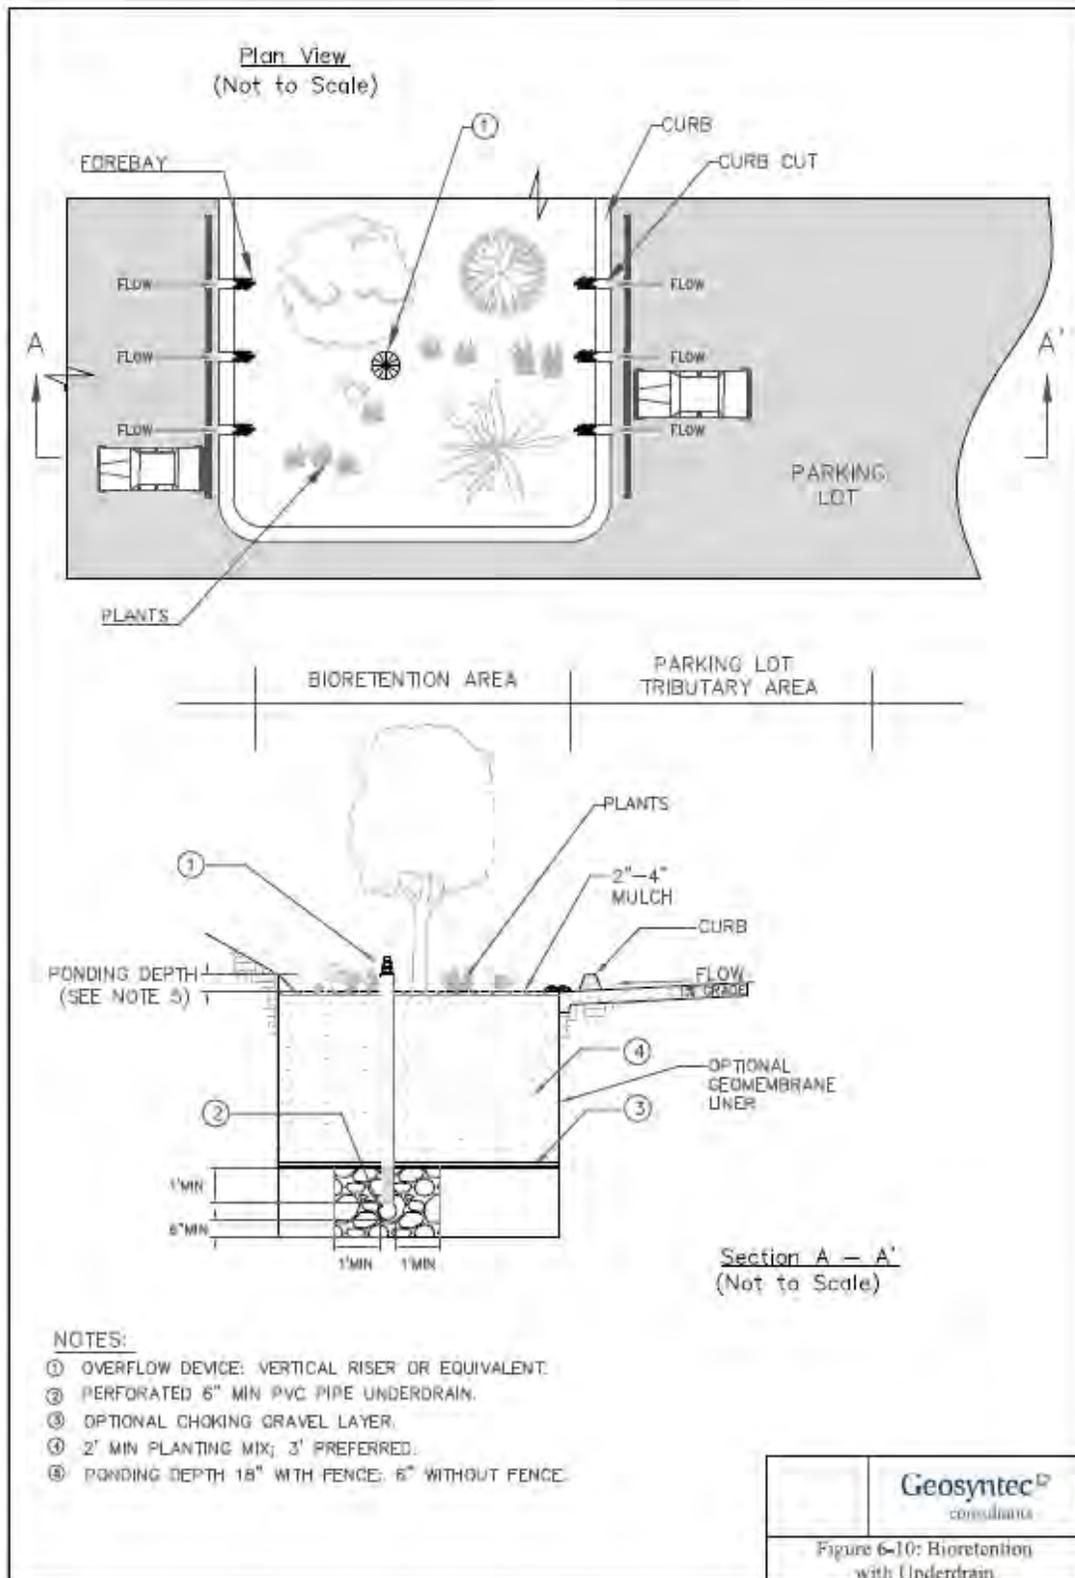

Figure F-3. Bioretention with Underdrain Conceptual Design Schematic

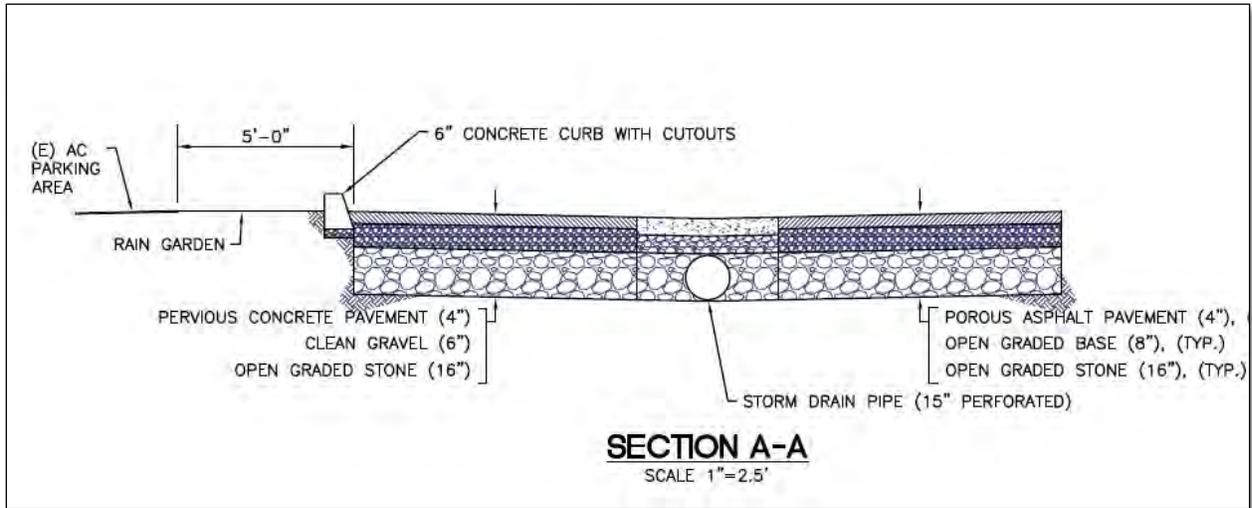

### 2.3.4 Green Streets (Permeable Pavement)

Green street projects can be designed as areas of permeable pavement bordered by rain gardens (bioretention with underdrains). Permeable pavement consists of a paved surface overlaying a gravel storage layer with underdrains. The pavement has less fine material than traditional concrete or asphalt which creates larger pore spaces that allows water to pass through. Permeable pavement reduces the stormwater runoff volume and peak flow when properly constructed and maintained, by allowing some of the stormwater to percolate through the pavement and infiltrate into the soil below. Permeable pavements allow for some stormwater treatment and volume reduction while maintaining the structural and functional features of the road, parking lot, or walkway.

The paving surface, subgrade, and installation requirements of permeable pavements are more complex than those for conventional asphalt or concrete surfaces. For porous pavements to function properly over an expected life span of 15 to 20 years, they must be properly sited, installed correctly, and have periodic maintenance performed to prevent clogging and failure (Geosyntec Consultants and LWA, 2011).

Permeable pavement conceptual designs are based on the plans for the Mall Alley green street project supplied by the City. Design parameters are listed below and conceptual schematic is shown in Figure F-4.

- Footprint Area: Determined based on space available for the BMP or the footprint needed to store the SQDV (as described in Section 2.3)
- Pervious pavement: 4 inches
- Open graded base: 8 inches (TGM recommends No. 8 aggregate)
- Open graded stone: 16 inches (TGM recommends No. 57 aggregate or 4 inches of No. 57 aggregate over No. 2 stone subbase)
- Pervious pavement porosity: 0.15
- Gravel/graded stone layer porosity: 0.40
- Maximum drawdown time of water stored in pore spaces: 72 hours
- Infiltration rate: Based on the site-specific hydrologic soil group (0.32 in/hr for hydrologic soil group C (NRCS, 2007))
- Discharge rate: Based on the most limiting rate out of the following considerations: infiltration rate (based on the underlying soil and surface area available for infiltration), rate of flow into the underdrain pipe (based on total BMP depth, orifice coefficient, and perforations in the underdrain), and rate of flow out of the underdrain pipe (based on Manning's equation using the estimated size, roughness, and slope of the underdrain)

**Figure F-4. Permeable Pavement with Underdrain Conceptual Design Schematic**

### 2.3.5 Direct Use

Direct use BMPs capture and store stormwater runoff for later use. They are designed to store a specific volume of water and can be in the form of above ground tanks, open reservoirs, or underground storage systems. The stored water can be used for landscape irrigation, indoor non-potable or industrial uses, among others.

Direct use BMPs typically include a diversion to pull stormwater from the runoff source, pretreatment to remove large sediment and debris, an overflow in case the storage capacity is exceeded, and a distribution system for later use. Additional levels of treatment may be required depending on the intended use. Preventative maintenance includes debris and sediment removal and inspections after rain events.

The projects are conceptually designed based on the TGM parameters for rainwater harvesting, and a conceptual schematic is shown in Figure F-5.

- Storage Volume: Based on drainage area size, runoff coefficient, and design storm depth
- Drawdown Time: Depends on intended use, typically 72 hours
- Tank Depth: Depends on drawdown time and available space
- Freeboard Depth: 1.0 ft suggested

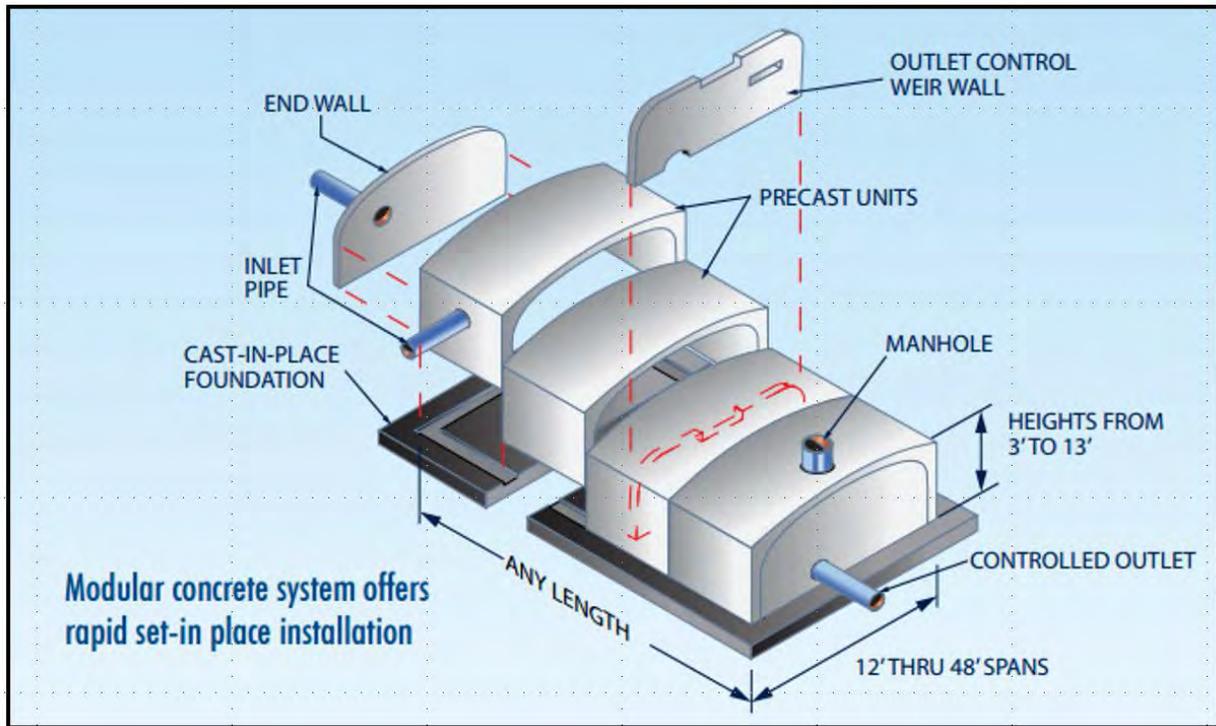

Figure F-5. Subsurface Storage Tank Concept (Contech Engineered Solutions, 2016)

**SECTION 3.**

## SECTION 4. MODELING APPROACH

Section VI.C of the Guidelines state that quantitative metric-based analysis should be employed to evaluate the multiple benefits (i.e., water quality, water supply, flood management, environmental, and community) associated with projects. To meet this requirement, water quality, water supply, and flood management benefits are quantified (i.e., modeled) for conceptual projects using the Load, Prioritization, and Reduction (LPR) Model, developed by Geosyntec Consultants. The LPR Model quantifies anticipated project benefits by estimating average annual stormwater runoff volumes<sup>2</sup> and associated pollutant loads that would be captured and infiltrated or treated by the proposed projects. While other models were evaluated for use, the LPR Model was selected because it met requirements outlined in the Guidelines, is cost-effective, and allows for updates in the future by the City. This section describes the evaluation of potential models for SWRP modeling and the selection of the LPR Model (Section 4.1) and how the LPR Model will be applied to evaluate conceptual project benefits (Section 4.2).

### 4.1 Model Selection

The Guidelines specify a minimum level of information necessary to determine if proposed projects meet SWRP’s management objectives. The following models were evaluated for their ability to quantify the benefits identified by the Guidelines and demonstrate that projects address necessary management objectives: The LPR Model, Structural BMP Prioritization and Analysis Tool (SBPAT), the EPA Stormwater Management Model (SWMM), and the Stormwater Tool to Estimate Load Reduction (TELRL).

More specifically, the Guidelines Section VI.C define metrics for evaluating stormwater and dry weather runoff capture projects benefits. These include:

- **Water quality:** pollutant load reduction and/or volume treated
- **Water supply:** volume captured and/or cost of water augmented
- **Flood management:** rate, volume, and/or size of decreased flood risk
- **Environmental:** size and/or rate of environmental/habitat protection and improvement, increased urban green space, reduced energy use, reestablishment of the natural hydrograph, or water temperature improvements
- **Community:** size of enhanced or new recreational/public use space, number of people involved with the community, or number of employment opportunities provided

---

<sup>2</sup> Dry weather water quality benefits may also be expected, but are not estimated here.

The Guidelines also define the minimum level of information necessary for an integrated metrics-based analysis to demonstrate that proposed projects will address the SWRP’s management objectives. Section VI.C of the Guidelines defines these as:

- Volume captured by the project, including the following:
  - Expressed as percentage of total runoff volume from the drainage area
  - Compared to the 85<sup>th</sup> percentile, 24-hour storm event
- Volume treated by the project and resulting pollutant load reductions achieved through treatment or infiltration, which also includes the following:
  - Quantification of how this captured volume may affect flooding risks
  - Difference between current and future pollutant loading after SWRP implementation
  - Stormwater and dry weather runoff infiltrated into a groundwater basin/aquifer and potable water offset resulting from the captured volume
  - Contribution to overland flow, groundwater recharge and infiltration, interflow, evapotranspiration, delivery of sediment and organic matter to receiving waters, and chemical and biological transformation
- Size of environmental habitat creation or improvement and community influence

Various modeling options were evaluated and narrowed down to four suitable models ranging from complex to simple. These included SBPAT, SWMM, TELR, and the LPR Model. Table F-2 compares the capabilities of the four models with respect to SWRP modeling requirements as well as other model features that would also be helpful. Sections 4.1.1 through 4.1.4 include additional information for each of the four potential models.

**Table F-2. Evaluation of Modeling Methodologies**

<b>Required Integrated Metrics-Based Analyses</b>	<b>SBPAT</b>	<b>SWMM</b>	<b>TELR</b>	<b>LPR Model</b>

Ability for the city to consistently evaluate new projects after completion of the SWRP			✓✓	✓✓
Ability to support catchment-level siting of BMPs that reflects County-specific priority water body-pollutant combination	✓✓			✓✓
Ability to perform watershed-wide analyses and summaries of volume and pollutant load reductions	✓✓		✓	✓✓

✓✓ - Model fully meets or exceeds required/desired feature

✓ - Model partially meets required/desired feature

<sup>1</sup>For decentralized BMPs, it is assumed that the BMPs are sized to remove stormwater volumes from the impervious area treated for the local 85<sup>th</sup> percentile, 24-hour storm event.

<sup>2</sup>TELRL only assesses total suspended solids (TSS) pollutant loadings, which is noted to be a surrogate for urban pollutants (2NDNATURE, 2016), while other models perform quantification for numerous pollutants.

<sup>3</sup>Models provide estimated runoff volume that is captured by a BMP and infiltrated. However, estimation of the portion of this infiltrated volume that is recharged to groundwater will be conducted outside of modeling framework. Potable water offset will also be estimated outside of modeling framework based on the runoff volume capture estimated by the models.

<sup>4</sup>Does not directly estimate groundwater recharge (as previously discussed), interflow, or chemical/biological transformation within the model interface.

<sup>5</sup>Does not directly estimate chemical/biological transformation or evapotranspiration within the model interface.

<sup>6</sup>Does not directly estimate groundwater recharge (as previously discussed), interflow, evapotranspiration, or chemical/biological transformation within the model interface.

<sup>7</sup>Does not directly estimate groundwater recharge (as previously discussed), interflow, evapotranspiration, or chemical/biological transformation within the model interface. However, estimation of runoff volumes within the LPR Model was calibrated to measured streamflow data. Therefore, runoff volumes predicted by the model indirectly account for factors such as evapotranspiration. Additionally, BMP performance is estimated in the LPR Model using summarized monitoring data from the International Stormwater BMP Database, which includes volume loss due to infiltration, evapotranspiration, etc.

<sup>8</sup>No models contain this functionality therefore this required quantification will be performed outside the model

#### 4.1.1 SBPAT

SBPAT is a public domain, “open source” GIS-based water quality analysis tool that is specifically designed to prioritize urban catchments based on unit area pollutant loading, identify regional structural BMP retrofit opportunity sites, and quantify BMP pollutant load reductions and costs. SBPAT (available at [www.sbp.net](http://www.sbp.net)) builds off the published and American Society of Civil Engineers (ASCE) award-winning structural BMP planning methodology

(www.labmpmethod.org). The tool was named by the Los Angeles Regional Water Quality Control Board to be one of only two models approved for use in Reasonable Assurance Analysis (similar in nature to the modeling required for the MS4 Permit TMDL requirements) and has been successfully demonstrated in over fifteen Southern California TMDL implementation plans and watershed management plans for MS4 BMP siting and prioritization purposes (e.g., City of Los Angeles Bureau of Sanitation, 2012, County of Ventura, 2015, Beach Cities EWMP Group, 2015, City of Los Angeles et al., 2015, North Santa Monica Bay Coastal Watersheds EWMP Group, 2015, Palos Verdes Peninsula Watershed Management Group, 2015, Geosyntec Consultants, 2012b, Geosyntec Consultants, 2012c, City of Los Angeles. 2009, Los Angeles Gateway Region, 2015, City of Walnut, 2015, Ventura County Watershed Protection District, 2010, etc.).

Although SBPAT meets most of the SWRP requirements, and many of the secondary factors as well, the tool provides unnecessary functionality (e.g., continuous hydrologic and hydraulic simulation) and level of detail (e.g., stochastic analysis) and therefore was not the most cost-effective option for use in the SWRP. Furthermore, additional training would be required for the City to consistently evaluate new projects after completion of the SWRP.

#### **4.1.2 SWMM**

SWMM, which was developed by EPA as a free, publicly available software, serves as a hydrologic and hydraulic model that can be used for long-term (continuous) simulation of runoff quantity and quality. Spatial variability of the hydrologic processes is achieved by dividing the area of interest into smaller, homogeneous catchments, containing a given fraction of pervious and impervious areas. The runoff volumes are estimated for catchment areas that receive precipitation and generate corresponding runoff and pollutant loads. The routing component of SWMM can then transport the runoff through any treatment system (i.e., BMP). SWMM is able to track the quantity and quality of runoff through each catchment and other components of the model, such as BMPs. SWMM is also able to account for hydrologic processes such as evaporation, rainfall interception from depression storage, percolation of infiltrated waters into groundwater layers, interflow between groundwater and the drainage system, etc.

After evaluating SWMM for use in quantifying benefits for the SWRP, it was determined that at the County-level, it would not meet all SWRP model requirements because: 1) it would be too data intensive to track runoff volumes and pollutant loads without the use of other tools such as Excel, 2) it does not have the capability to directly produce catchment-level siting based on priority water body-pollutant combinations (which LPR Model does), and 3), it would not be easy for the City to add new projects as they are developed.

#### **4.1.3 TELR**

TELR is a proprietary, easy to use model that produces estimates of average annual runoff volume and sediment loads and load reductions using a spatial, catchment-scale analysis. A baseline average annual total suspended solids (TSS) load is estimated based on land use distribution and

unmodified hydrologic connectivity of the catchment to the receiving waters, and the average annual pollutant load reductions are estimated after implementation of stormwater program actions, including source control and structural BMPs, in the catchment for the respective year evaluated. The current loading after BMPs for each catchment area are normalized to produce catchment rankings.

After evaluation with respect to SWRP, it was determined that the TELR model is not appropriate for use in evaluating conceptual project benefits because: 1) it does not currently incorporate pollutant-based catchment loading (runoff volume and sediment loads are instead used as surrogates), 2) it also cannot prioritize catchments based on specific water body-pollutant combinations, and 3) it requires additional annual costs, making it a less cost effective option for the City.

#### **4.1.4 LPR Model**

The LPR Model<sup>3</sup> was developed to fulfill the 2013 California Phase II General Municipal Separate Storm Sewer System (MS4) Permit (MS4 Permit) (State Water Resources Control Board, 2013) and Central Coast Regional Water Quality Control Board requirements for quantifying MS4 Permit area average annual stormwater runoff volumes and pollutant loads, prioritizing catchments for BMP implementation, and inventorying, assessing, and estimating runoff volume and pollutant load reductions achieved by a MS4 Permittee's stormwater program.

The LPR Model's primary functions include quantification of runoff volumes and pollutant loads for the unmitigated scenario, prioritization of catchments, and estimation of runoff volume and pollutant load reductions from implementation of a stormwater program, including a suite of BMPs (mitigated condition). Therefore, the model is referred to as the **L**oad, **P**rioritization, and **R**eduction (LPR) Model. The model produces all results at the catchment, MS4 Permit area, and watershed scale.

Spatial data describing the area of interest, including land uses and soil types, are combined with historical rainfall data to determine predicted average annual runoff volumes for the unmitigated scenario. These volumes are then combined with the pollutant concentrations expected on various land uses to produce average annual stormwater pollutant loads. POCs are identified, based on those with significant potential to cause or contribute to receiving water limit exceedances and watershed-specific factors (e.g., status of Clean Water Act Section 303(d) listings and TMDLs), and used, with pollutant loads, to produce catchment prioritization results based on various pollutants. The LPR Model then computes the water quality benefits, in the form of estimated

---

<sup>3</sup> The LPR Model was developed by Geosyntec Consultants in collaboration with the County of Santa Barbara, and the Cities of Carpinteria, Goleta, Solvang, and Buellton.

runoff volume and pollutant load reductions, expected to be achieved by implementing BMPs, for a variety of BMP types (both structural and non-structural) and implementation scenarios.

The LPR Model is a simple, easy-to-use tool that can directly evaluate and support stormwater program management. The LPR Model is in the non-proprietary Microsoft Excel format because the software is widely used, it is flexible and customizable, and requires no ongoing cost. The streamlined and intuitive layout allows for future use and modification based on additional land use monitoring data, modified watershed GIS data, additional BMP performance data, and/or expanded BMP implementation. Output results from the LPR Model are provided in both tabular and graphical form to allow for easy transfer to reports.

The LPR Model is well-suited to meet watershed planning and multi-benefit quantification requirements necessary for the SWRP, in addition to prioritizing BMPs for mitigating various land use-based threats to water quality by comparing their relative benefit, supporting catchment-level siting of BMPs that reflect priority water body-pollutant combinations, and performs watershed-wide analyses and summaries of volume and pollutant load reductions. The LPR Model demonstrated prior project analysis and quantification capabilities during the Santa Barbara County-Wide Integrated SWRP development process.

#### **4.1.5 Conclusion**

Based on the criteria discussed above and summarized in Table F-2, the LPR Model was selected as the best and most cost-effective option for use in development of the Redding SWRP to meet the modeling requirements of the Guidelines. The LPR Model is able to produce average annual runoff volumes and pollutant loads for 12 different pollutants, in a given area, based on land use and soil spatial data and average annual rainfall for the area. The LPR Model includes the capability to estimate the percent of long-term runoff volume that is captured by structural BMPs, allowing the City of Redding to take full ownership of a simple-to-use comprehensive SWRP modeling tool. The LPR Model is able to estimate the runoff volume stored, treated, and/or infiltrated, and the corresponding pollutant load reductions, for a variety of structural BMPs.

Besides fulfilling requirements outlined in the Guidelines, other advantages of the LPR Model include its cost-effectiveness and its ability to easily add and inventory additional projects in the future. It also has the ability to support catchment-level siting of BMPs that reflects City-specific priority water body-pollutant combinations, in addition to providing output summaries by watershed or receiving water.

#### **4.2 LPR Model Development**

The LPR Model uses the Rational Method to estimate the average annual runoff volume generated within a watershed, using drainage area characterization (land use, imperviousness, and soils), runoff coefficients, and precipitation data. Since runoff coefficients are determined using an empirical formula that does not account for all site-specific conditions, the LPR Model allows

modeled runoff volumes to be adjusted based on calibration results that compare the annual discharge volumes calculated by the LPR Model to streamflow gage observed annual discharge volumes<sup>4</sup>. Adjusted runoff volumes reported by the LPR Model are then used with pollutant event mean concentrations (EMCs), representing the mean concentration of a pollutant expected in stormwater runoff, to determine average annual pollutant loadings.

Basic design details of stormwater projects (e.g., project type, drainage area and characteristics, project footprint and storage capacity, etc.) are then entered into the LPR Model for performance modeling. The LPR Model computes the estimated average annual infiltration volumes and pollutant load reductions, expected to be achieved by implementing the project. Project performance within the LPR Model is based on the average annual percent volume capture (percent capture), effluent quality (i.e., concentration), and percent volume reduction (see Figure F-6). Additional information and details on the LPR Model are presented in the LPR Model Technical Report (Geosyntec Consultants, 2017).

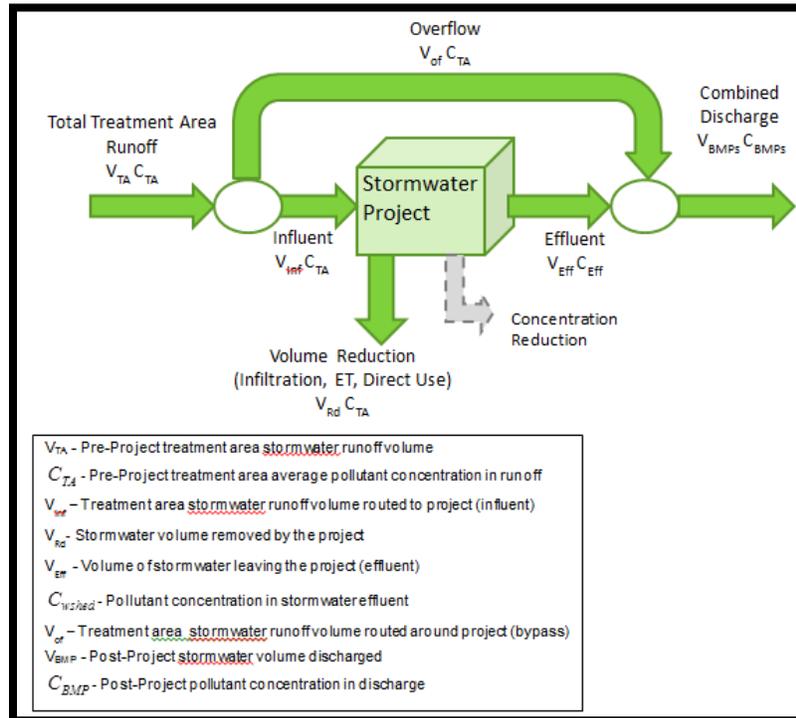

Figure F-6. Structural BMP Modeling Approach

<sup>4</sup> A calibration was not performed due to the lack of available urban streamflow data that is appropriate for the City.

### 4.2.1 Existing LPR Model

The LPR Model was populated (previously compiled and synthesized in GIS) with all the necessary spatial data that was compiled and synthesized in GIS, as shown in Table F-3, for the area within the City and the major watersheds that intersect the City. This spatial data was developed at the catchment level, which are defined as municipal drainage catchments and represent actual drainage areas where stormwater discharges through one or more identified outfall. Within each catchment, the LPR Model contains information for each unique combination of land use (land use category and imperviousness) and hydrologic soil group. Each catchment is also characterized by a receiving water (i.e., subwatershed) and watershed. Catchments were developed by the City for areas within the City boundaries. Details regarding how land use designations and imperviousness were determined for areas within the City are included in Attachment A of the LPR Model Technical Report (Geosyntec Consultants, 2017).

**Table F-3. GIS Datasets Used for the Existing LPR Modeling**

<b>Dataset Description<sup>1</sup></b>	<b>Dataset Format</b>	<b>Source</b>
Land Use (event mean concentration [EMC] land use <sup>2</sup> )	Vector (polygon)	Based on land use designations provided by the City of Redding Parcel file, with areas outside of parcels (i.e., roadways) based on the 2017 update of the 2002 City zoning file, and areas outside of the City based on the 2005 Shasta County land survey by CA DWR
Imperviousness	Raster	NLCD 2011 Percent Developed Imperviousness
Catchments	Vector (polygon)	Provided by the City or developed based on subwatersheds
Soils (hydrologic soil group)	Vector (polygon)	Soil Survey Geographic Database (SSURGO) database from the Natural Resources Conservation Service (United States Department of Agriculture)
Watersheds	Vector (polygon)	USGS hydrologic unit code (HUC) – 10
Subwatersheds	Vector (polygon)	USGS hydrologic unit code (HUC) – 12

<sup>1</sup> Additional information is included in the LPR Model Technical Report (Geosyntec Consultants, 2017).

<sup>2</sup> Single-family residential, multi-family residential, transportation, vacant (open space), commercial, industrial, agriculture, education, and water.

## **SECTION 5. QUANTITATIVE ANALYSIS OF PROJECT BENEFITS**

Table 3 of the Guidelines lists examples of the appropriate benefit metrics to be used in project analysis. The metrics for quantitative analysis included in this SWRP include pollutant load reductions (water quality benefit), groundwater recharge (water supply), runoff volume removal (flood management), and habitat restoration (environmental).

Water quality benefits of conceptual projects, in terms of the average annual pollutant loads that are expected to be removed from the receiving waters after implementing the conceptual projects, are evaluated by the LPR Model. For infiltration-based projects such as the infiltration basin, removing runoff volume from the BMP discharge also removes all associated pollutants. Therefore, the pollutant loading in the influent runoff volume that is able to be captured and infiltrated by the projects is also considered to be removed. Treatment-based BMPs, such as natural treatment systems and bioretention with underdrains, estimate the effluent quality of the runoff volume that is captured and treated by the projects and discharged, in addition to runoff volume that is removed through infiltration or evapotranspiration.

The water supply benefits for conceptual projects is also based on the volume of runoff infiltrated by the project. The infiltrated volume is multiplied by an adjustment factor to compute a potential groundwater recharge volume. This adjustment factor is based on a modeling analysis of groundwater recharge performed by Munévar and Mariño (in the Central California region), which showed that on average approximately 65 percent of infiltrated water reaches the water table and is therefore available for water supply (Munévar and Mariño, 1999). Therefore, the potential water supply volume provided by infiltration-based BMPs is calculated to be 65 percent of the estimated captured (or reduced) runoff volume.

Additionally, the number of households that could utilize their entire yearly water supply from the potential increase in water supply volume (household equivalents supplied) is also estimated, based on average annual household water use, 0.41 acre-ft per household per year or 362 gallons per household per day (Aquacraft, 2011), and the estimated groundwater recharge volumes.

Implementation of the conceptual projects can also provide benefits by reducing local flooding, both by reducing the rate and volume of runoff volume during storm events. These flood management benefits were quantified by the LPR Model as the average annual runoff volume that is captured by the conceptual project, then infiltrated/evapotranspired and/or detained and released at a controlled rate.

Implementation of the conceptual projects can also result in positive environmental outcomes. The Guidelines identifies protection and improvement of natural habitat, increased urban green space, reduced energy use or greenhouse gas emissions, reestablishment of the natural hydrograph, and water temperature improvement as examples of environmental benefits. Potential environmental benefits of conceptual projects are quantified by the size of the footprint for the proposed project,

when it represents the area that will undergo environmental enhancements (e.g., natural habitat created or converted to green space with natural vegetation, removal of invasive species).

The conceptual project design parameters used in the LPR Model and multi-benefit quantification results are included in Appendix G.

## **SECTION 6. PROJECT MULTIPLE BENEFIT PRIORITIZATION**

As required by California Water Code Section 10562(e) and Section VI.D of the Guidelines, the SWRP must use measurable factors to prioritize projects. The approach for prioritizing the conceptual projects consists of two parts. Projects are first assigned multi-benefit indices based on their quantitative and qualitative potential to achieve multiple benefits in the five benefit categories identified by the Guidelines: water quality, water supply, flood control, community, and environmental. Projects were then prioritized based on their multi-benefit indices and their potential to be implemented and maintained (i.e., with a committed landowner and operation and maintenance capabilities).

The methodology for scoring multiple benefits to determine multi-benefit indices is outlined in Section 6.1, and the process for prioritizing projects is described in Section 6.2. These processes vary slightly for those projects with quantified modeling results (conceptual projects) and other projects that have not been modeled to determine quantitative benefits. The methodologies for both modeled and non-modeled projects are described herein.

The results for scoring multiple benefits, including determination of the multi-benefit indices and prioritization of conceptual projects, are presented in Appendix G.

### **6.1 Scoring Multiple Benefits**

#### ***Conceptual Projects***

The multi-benefit index is calculated for each project and represents the ability of each project to provide benefits for the benefit categories identified in the Guidelines, with more emphasis on the benefit categories that are a priority to the City. To determine a multi-benefit index for each modeled conceptual project, scores for each benefit category (benefit scores) are determined as described in Table F-4. These quantitative benefit scores are normalized by dividing quantitative results (e.g. modeled pollutant loads) by the maximum value<sup>5</sup> for all projects and multiplying normalized values by five, yielding scores ranging from zero to five. These scores based on quantitative metrics are used to calculate quantitative benefit scores for water quality, water supply, flood control and environmental benefits as appropriate, as described in Table F-4. Water quality quantitative benefit scores differed slightly from the other benefit categories, in that a quantitative score ranging from zero to five is determined for each modeled pollutant. Scores for

---

<sup>5</sup> The maximum value is the largest quantitative result that is less than or equal to the “upper limit” of all quantitative results, which is calculated as the median + (1.5 x the interquartile range [IQR]). The IQR is equal to the 25<sup>th</sup> percentile value subtracted from the 75<sup>th</sup> percentile value. This procedure is used so that one or a couple very large projects do not result in very low quantitative scores for all other projects. Any projects with a quantitative result greater than the upper limit automatically receives a score of 5.0 for that pollutant/category.

each pollutant are then weighted by the pollutant priority weights for the relevant watershed, shown in Table F-7, to determine an overall water quality quantitative benefit score for each project. Priority pollutant weights are determined based on 303(d) and TMDL listed pollutants, in addition to urban vs. non-urban pollutants, as described in the water quality portion of Table F-4.

A qualitative benefit weight from zero to five is also determined for certain criteria, based on the project concept, aspects of the location of the project (proximity to groundwater basin, upstream of etc.), need for the benefit in the project area, and best professional judgement to reflect the effectiveness of the project at achieving each benefit. The overall benefit scores for water supply, flood control and environmental benefits are calculated by multiplying the quantitative score and qualitative weight and dividing by five to yield a final benefit score between zero and five. Water quality benefits are based solely on the quantitative scores and pollutant treatment priority weights, while community benefits are based entirely on a qualitative score.

Finally, in order to determine a multi-benefit index for each project, each benefit category is assigned a weight according to its relative importance to the City. The following multi-benefits weights are applied to each benefit:

- Water quality: 30%
- Water supply: 20%
- Flood management: 20%
- Environmental: 20%
- Community: 10%

The benefit scores are multiplied by the assigned multi-benefit weights and summed to calculate a multi-benefit index between zero and five. This approach is similar in concept to the ASCE award-winning Los Angeles Countywide BMP prioritization methodology ([www.LABMPmethod.org](http://www.LABMPmethod.org)). Table F-4 outlines the methodology described above (for conceptual projects), and potential environmental and community benefits are identified in Table F-5 and Table F-6. The qualitative scores for environmental and community benefits are selected based on the number of main and additional benefits that each project is expected to provide, as defined in the Guidelines.

**Table F-4. Multi-benefit Scoring Guidance for Conceptual Projects**

<b>Benefit Category</b>	<b>Description</b>	<b>Scoring</b>
Water Quality	Potential to address water quality priorities	<p>Score is calculated based on quantitative metric of benefit multiplied by a qualitative pollutant weight</p> <p><b>Quantitative metric:</b> Average annual pollutant load reduction (lb/year or 10<sup>12</sup> MPN/year for fecal coliform) will be used to calculate a weighted score for each project based on qualitative watershed specific water quality priorities.</p> <p><b>Quantitative pollutant priority weights (shown in Table F-7):</b>            4 = TMDL listed            3 = 303(d) listed            2 = Urban, non-listed (TMDL or 303(d)) pollutant            1 = Non-urban, non-listed (TMDL or 303(d)) pollutant</p>
Water Supply	Maximize infiltration, supplement groundwater, or reuse of captured stormwater or dry weather runoff	<p>Score is calculated based on quantitative metric of benefit multiplied by a qualitative weight describing the effectiveness of the project at meeting that metric.</p> <p><b>Quantitative metric:</b> Potential average annual water supply volume (acre-ft/yr)</p> <p><b>Qualitative weight:</b>            0 = No infiltration or planned reuse            1 = Provides infiltration in a confined aquifer (not used for water supply) or direct use (in a parcel not currently using water)            2 = Improved water efficiency with drought tolerant vegetation or removal of high water use vegetation            3 = Provides groundwater recharge in an unconfined aquifer (not used for water supply) or direct use (in a parcel using recycled water)            4 = Provides infiltration in a confined aquifer (used for water supply)            5 = Provides groundwater recharge in an unconfined aquifer (used for water supply) or direct use (in a parcel using potable water)</p>

Benefit Category	Description	Scoring
Flood Management	Minimize runoff / discharge	<p>Score is calculated based on quantitative metric of benefit multiplied by a qualitative weight describing the effectiveness of the project at meeting that metric.</p> <p><b>Quantitative metric:</b> Average annual runoff volume captured<sup>6</sup> (cu-ft/yr)</p> <p><b>Qualitative weight:</b>            0 = No alleviation of a local flooding problem            1 = Minor alleviation of a local flooding problem            3 = Medium alleviation of a local flooding problem            5 = Significant alleviation of a local flooding problem</p>
Environmental	Environmental benefits of project, listed in <b>Table F-5</b>	<p>Score is calculated based on a quantitative metric of benefit multiplied by a qualitative weight.</p> <p><b>Quantitative metric:</b> Environmental enhancement area (represented by BMP footprint in square feet)</p> <p><b>Qualitative weight:</b>            A qualitative weight will be determined by the number of benefits in <b>Table F-5</b>, as follows.            0 = No environmental benefit            1 = One (or more) additional environmental benefits and no main benefits            3 = One main environmental benefit            5 = Two (or more) main environmental benefit</p>
Community	Community benefits of project, listed in <b>Table F-6</b>	<p>A qualitative score is determined by the number of benefits in <b>Table F-6</b> as follows.            0 = No community benefit            1 = One (or more) additional community benefits and no main benefits            3 = One main community benefit            5 = Two (or more) main community benefit</p>

---

<sup>6</sup> Runoff volume metric used in lieu of peak flow since peak flow is not available.

**Table F-5. List of potential environmental benefits**

Benefit Description	Evaluation Criteria
<i>Main Benefits</i>	
Environmental and habitat protection and improvement, including: <ul style="list-style-type: none"> <li>• Wetland enhancement/creation</li> <li>• Riparian enhancement; and/or</li> <li>• Instream flow enhancement</li> </ul>	<ul style="list-style-type: none"> <li>• Parcel is located near a water body and could enhance or restore aquatic existing habitat</li> <li>• BMP concept creates a water feature that could create habitat (e.g. constructed wetland)</li> <li>• Parcel or BMP concept can be developed in a way that enhances or creates habitat or provides other environmental restoration (e.g. opportunity to plant native species)</li> </ul>
Increased urban green space	<ul style="list-style-type: none"> <li>• Parcel is located in an urban area</li> <li>• Undeveloped space on parcel could be converted to green space or BMP concept includes plantings (e.g. bioretention)</li> </ul>
<i>Additional Benefits</i>	
Reduced energy use, greenhouse gas emissions, urban heat island effect, or provides carbon sink	<ul style="list-style-type: none"> <li>• BMP concept increases water supply through infiltration or capture reuse and reduces energy used for importing water</li> <li>• Project creates green space</li> </ul>
Reestablishment of natural hydrograph	<ul style="list-style-type: none"> <li>• Project reduces runoff and helps restore stream flow to predevelopment conditions</li> </ul>

**Table F-6. List of potential community benefits**

<b>Benefit Description</b>	<b>Evaluation Criteria</b>
<b>Main Benefits</b>	
Employment opportunities	<ul style="list-style-type: none"> <li>Project requires operation and maintenance</li> </ul>
Public education	<ul style="list-style-type: none"> <li>Project includes signage or other opportunities to educate the public about stormwater and water quality, water supply, environmental protection or other aspects of the project.</li> </ul>
<b>Additional Benefits</b>	
Community involvement	<ul style="list-style-type: none"> <li>Project implementation will engage community</li> </ul>
Enhance or create recreational and public use areas	<ul style="list-style-type: none"> <li>Project is located in an existing public space or park</li> <li>Project provides aesthetic benefits</li> <li>Project includes recreational facilities (e.g. bike paths)</li> </ul>
Socio-economic benefits	<ul style="list-style-type: none"> <li>Project is located in a residential area and may improve home property values</li> <li>Project is located in a commercial area and may benefit local businesses</li> <li>Project is located in a disadvantaged or low-income area</li> </ul>
Health benefits	<ul style="list-style-type: none"> <li>Project will increase green space that will improve air quality</li> <li>Project provides recreation opportunities that encourage physical exercise</li> </ul>

**Table F-7. Priority Pollutant Weight Scores**

<b>Watershed</b>	<b>Pollutant Weights</b>											
	<b>TSS</b>	<b>TP</b>	<b>Diss P</b>	<b>NH3</b>	<b>NO3</b>	<b>TKN</b>	<b>Diss Cu</b>	<b>Tot Cu</b>	<b>Tot Pb</b>	<b>Diss Zn</b>	<b>Tot Zn</b>	<b>Fecal Col.</b>
Churn Creek-Sacramento River	2	1	2	1	1	1	2	1	1	2	1	2
Clear Creek	2	1	2	1	1	1	2	1	1	2	1	2
Stillwater Creek	2	1	2	1	1	1	2	1	1	2	1	2

***Non-Modeled Projects***

The multiple benefit scoring process developed for evaluating projects that are identified, developed (to a conceptual level), and modeled for the SWRP was adapted and will be applied to those identified projects that are not conceptually developed or modeled (i.e., non-modeled projects). Benefit scores for these projects are developed based on the same qualitative process used for conceptual projects, however quantitative metrics, such as the volume captured, are not available for all of these projects. Thus, the benefit scores for water quality, water supply, flood management, environmental, and community are represented by a score from zero to five based

on a qualitative assessment of a specific project type implemented in the identified parcel at achieving each benefit, independent of size or scale of the project. Table F-8 shows how the scoring process was adapted for non-modeled projects for which BMP concept designs have not been developed.

**Table F-8. Multi-benefit Scoring Guidance for Non-modeled Projects**

Benefit Category	Description	Scoring
Water Quality	Potential to address water quality priorities	0 = No pollutant removal 1 = Low pollutant removal in discharge 3 = Medium pollutant removal in discharge 5 = Full pollutant removal of captured/diverted flow
Water Supply	Maximize infiltration, supplement groundwater, or reuse of captured stormwater or dry weather runoff	0 = No infiltration or planned reuse 1 = Provides infiltration in a confined aquifer (not used for water supply) or direct use (in a parcel not currently using water) 2 = Improved water efficiency with drought tolerant vegetation or removal of high water use vegetation 3 = Provides groundwater recharge in an unconfined aquifer (not used for water supply) or direct use (in a parcel using recycled water) 4 = Provides infiltration in a confined aquifer (used for water supply) 5 = Provides groundwater recharge in an unconfined aquifer (used for water supply) or direct use (in a parcel using potable water)
Flood Management	Minimize runoff / discharge	0 = No alleviation of a local flooding problem 1 = Minor alleviation of a local flooding problem 3 = Medium alleviation of a local flooding problem 5 = Significant alleviation of a local flooding problem
Environmental	Environmental benefits of project, listed in <b>Table F-5</b>	A qualitative score will be determined by the number of benefits in <b>Table F-5</b> , as follows.  0 = No environmental benefit 1 = One (or more) additional environmental benefits and no main benefits 3 = One main environmental benefit 5 = Two (or more) main environmental benefit
Community	Community benefits of project, listed in <b>Table F-6</b>	A qualitative score will be determined by the number of benefits in <b>Table F-6</b> , as follows.  <b>Qualitative metric:</b> 0 = No community benefit 1 = One (or more) additional community benefits and no main benefits 3 = One main community benefit 5 = Two (or more) main community benefit

## 6.2 Project Prioritization

After multi-benefit indices are determined for the projects, they are then prioritized (Water Code 10562(b)(2)) based on their multi-benefit indices and other factors related to feasibility of implementation and commitment to maintenance as shown below:

- High: multi-benefit index greater than zero and the project has a willing land owner that is also committed to performing necessary maintenance
- Medium: multi-benefit index greater than three, but the project does not have (or it is undetermined) a willing land owner also committed to maintenance
- Low: multi-benefit index less than or equal to three and the project does not have (or it is undetermined) a willing land owner also committed to maintenance

This approach for multiple benefit quantification and prioritization of projects was developed to fulfill requirements in the Water Code and Guidelines, and the methodology will serve as a useful tool for evaluating multiple benefits of projects. However, this methodology is not intended to serve as a basis for ranking projects or to imply that certain projects are more likely to be successful than others, but rather was intended to identify projects that will provide multiple benefits and are likely to succeed once implemented.

## **SECTION 1. INTRODUCTION**

Various project opportunities for stormwater and dry weather capture were identified in the City of Redding (City) that meet one or more of the criteria established for project selection included in the Water Code and the SWRP Guidelines (Guidelines) (SWRCB, 2015). These identified projects were then evaluated by the condition of the parcel, the potential benefits of the project, and barriers to implementation to establish a ranked list of projects for each BMP type. The City reviewed the ranked projects and the projects identified by the Technical Advisory Committee (TAC) and stakeholders, and projects were selected for conceptual development. The conceptual designs and project benefits (water quality, water supply, flood management, and environmental) are described and quantified in this document as required by the Water Code and Guidelines. This document contains the resulting conceptual designs, quantified benefits, and prioritization using the methods outlined in Appendix F.

## **SECTION 2. CONCEPTUAL PROJECT DESIGNS**

The project identification and ranking process was executed for each of the SWRP project types (natural treatment systems, green streets, and direct use), as described in Appendix E. The City reviewed their list of ranked projects (by SWRP project type) and potential projects identified by the TAC and stakeholder and currently selected projects for design concept development are included in Table G-1. Development of conceptual designs for the projects required delineating the upstream drainage area and determining appropriate conceptual design parameters. These processes, including the necessary spatial files, are described in Appendix F. Table G-2 shows the drainage area and average imperviousness for each conceptual project. Additionally, the location and drainage area of the conceptual projects, in relation to water quality priorities, are shown in Figure G-1.

**Table G-1. Projects Selected for Conceptual Development**

<b>Project Name</b>	<b>Parcel/Street</b>	<b>Project Type</b>	<b>Short Description</b>
Former City Sewer Ponds	116180006000, 117070028000	Natural Treatment System	Utilize existing abandoned sewer ponds to treat, retain, and infiltrate flows from Boulder Creek through natural treatment systems. The upper basin will be expanded, while the lower basin will retain the current footprint.
Linden Ditch	Series of 26 city-owned parcels along Linden Avenue at West Street	Infiltration System	Offline linear infiltration basin adjacent to the current flow path to improve water quality and reduce flows in Linden Ditch.
Mary Lake Pond	204350040000, 204560040000, 204330030000	Lake Restoration	Enhance the existing wet detention basin above Mary Lake and construct natural treatment systems at the western and eastern sides of Mary Lake to capture and treat surrounding runoff. Also includes a storage tank to capture peak flows in the winter to later release during dry months.
Market-Pine Alley	Market-Pine Alley at Eureka Way	Green Street	Convert the alley between Market and Pine Street in downtown Redding into a green pedestrian corridor by replacing the existing alley surface with permeable pavement and rain gardens with an underdrain system.
Downtown Mall Alley <sup>a</sup>	California-Market Alley	Green Street	Create green streets with rain gardens in the alley and walkway between the parking lot and mall for water treatment, infiltration, and education.

<sup>a</sup>. This project was previously designed by Corri Vandiver (City of Redding) but included here for project benefit modeling.

**Table G-2. Conceptual Project Drainage Areas and Imperviousness**

<b>Project Name</b>	<b>Project Type</b>	<b>Drainage Area (acre)</b>	<b>Imperviousness</b>
Former City Sewer Ponds	Natural treatment system	1,836	37%
Linden Ditch	Infiltration system	258	23%
Mary Lake Pond	Lake restoration	456	8.7%
Market-Pine Alley	Green street	3.5	82%
Downtown Mall Alley	Green street	3.9	83%

## **SECTION 4. CONCEPTUAL PROJECT LPR MODEL INPUTS**

Section VI.C of the Guidelines state that quantitative metric-based analysis should be employed to evaluate the multiple benefits (i.e., water quality, water supply, flood management, environmental, and community) associated with projects. To meet this requirement, water quality, water supply, and flood management benefits were quantified (i.e., modeled) for each conceptual project using the Load, Prioritization, and Reduction (LPR) Model, developed by Geosyntec Consultants. The LPR Model quantifies anticipated project benefits by estimating average annual stormwater runoff volumes<sup>1</sup> and associated pollutant loads that would be captured and infiltrated or treated by the proposed projects.

The LPR Model requires two sets of project details to estimate performance: (1) project drainage area details and (2) project design details. As described in Appendix F, the drainage areas were delineated using GIS and desktop visual observations for each conceptual project. These conceptual project drainage areas were then characterized utilizing GIS tools, such that each conceptual project drainage area was described by unique combinations of catchment (i.e., catchment for areas within the City or subwatershed for areas outside of the City) and land use. Table G-3 summarizes conceptual project LPR Model input data related to drainage area. The necessary LPR Model design input details for each conceptual project were developed based on the available project area, the SQDV, and the standard design parameters as discussed in Appendix F. Table G-4 shows the conceptual project design details used in the LPR Model.

---

<sup>1</sup> Dry weather water quality benefits may also be expected, but are not estimated here.

**Table G-3. Conceptual Projects Drainage Area Inputs to the LPR Model**

Project Name	Project Type (LPR Model name)	Drainage Area Characteristics										
		Size (acre)	Juris- dictions	Catchments	Land Uses (% of total drainage area)							
					Agriculture	Commercial	Education	Industrial	Multi-family Residential	Open Space	Single-family Residential	Transpor- tation

**Table G-4. Conceptual Projects Design Inputs to the LPR Model**

<b>Project Name</b>	<b>Project Type (LPR Model name)</b>	<b>BMP Effective Depth (ft)</b>	<b>BMP Storage Capacity (cu ft)</b>	<b>BMP Footprint (not including pretreatment area) (sq ft)</b>	<b>Drawdown Time (hr)</b>	<b>Infiltration Rate (in/hr)</b>
Former City Sewer Ponds	Natural Treatment System (Wet basin [extended detention])	3.7 <sup>1</sup>	2,000,000	580,000 <sup>2</sup>	165	0.32
Linden Ditch	Infiltration system	6	330,000	56,000	48	1.5
Mary Lake Pond	Upper - Natural Treatment System (Wet basin [extended detention])	3.8 <sup>1</sup>	520,000	90,000 <sup>2</sup>	166	0.32
	West - Natural Treatment System (Wet basin [extended detention])	3.4 <sup>1</sup>	120,000	41,000 <sup>2</sup>	147	0.32
	East - Natural Treatment System (Wet basin [extended detention])	3.2 <sup>1</sup>	63,000	25,000 <sup>2</sup>	142	0.32
Market-Pine Alley	Porous pavement	0.85	5,000	5,900	- <sup>3</sup>	5.5 cfs through underdrain
	Rain garden (bioretention with underdrain)	1.0	1,000	1,200	- <sup>4</sup>	0.32
Downtown Mall Alley	Porous pavement	0.85	17,000	20,000	- <sup>3</sup>	3.6 cfs through underdrain
	Rain garden (bioretention with underdrain)	1.0	1,600	1,850	- <sup>4</sup>	0.32

<sup>1</sup> Approximated as the volume-weighted depth of the deep zone (3-5 ft) and the shallow vegetated zone (2.0 ft).

<sup>2</sup> These natural treatment systems include a sedimentation forebay as part of the BMP footprint

<sup>3</sup> Drawdown time was not needed since percent capture is based on the flow rate through the underdrain and the BMP storage capacity.

<sup>4</sup> Percent capture was determined using the National Cooperative Highway Research Program (NCHRP) BMP Evaluation Tool Version 1.0 developed by Geosyntec Consultants based on a ponding depth of 4 in, planting media thickness of 7 in, stone reservoir thickness of 1.3 ft, mulch depth of 1 in, planting media filtration rate of 2 in/hr, stone freely drained storage of 0.35 in/in, and mulch porosity of 0.4 in/in (in addition to other default assumptions for bioretention with underdrains).

## **SECTION 5. SUMMARY OF QUANTIFIED PROJECT BENEFITS**

Table 3 of the Guidelines lists examples of the appropriate benefit metrics to be used in project analysis. A description of the metrics for quantitative analysis included in this SWRP, including: pollutant load reductions (water quality benefit), groundwater recharge (water supply), runoff volume removal (flood management), and habitat restoration (environmental) are discussed in detail in Appendix F.

The modeled average annual benefits achieved by the conceptual projects are shown in Table G-5. These include the conceptual projects quantified results for pollutant load reductions, groundwater recharge volume, runoff volume removed, and habitat created.

**Table G-5. Quantified Average Annual Benefits of Conceptual Projects**

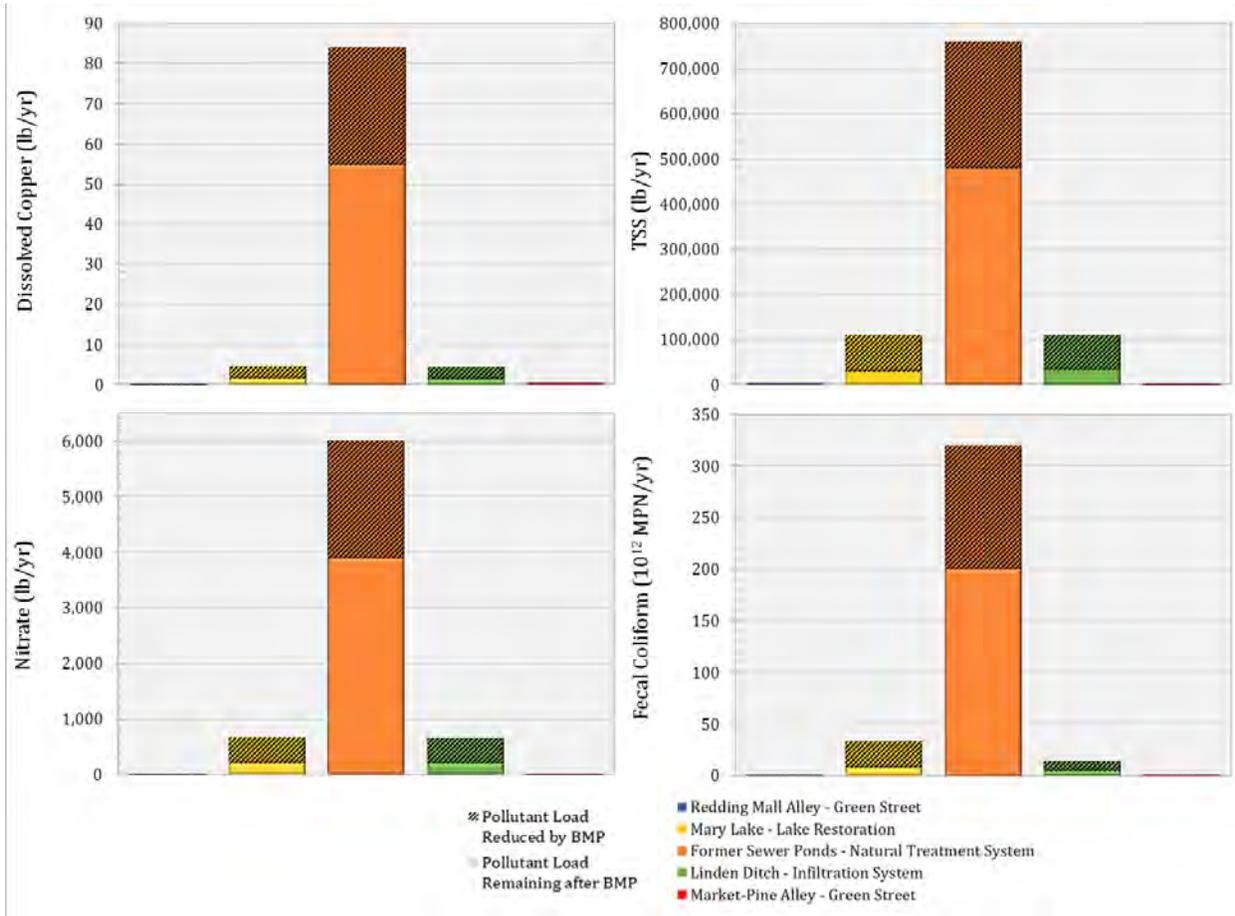

Project Name	Project Type	Percent Capture	Water Quality Benefits												Water Supply Benefits		Flood Management Benefits	Environmental Benefits
			Pollutant Load Reductions												Groundwater Recharged Volume	Equivalent Households Supplied	Runoff Volume Controlled	Environmental Enhancement Area
			TSS	Tot P	Diss P	NH3	NO3	TKN	Diss Cu	Tot Cu	Tot Pb	Diss Zn	Tot Zn	Fecal Col.				
lb	lb	lb	lb	lb	lb	lb	lb	lb	lb	lb	lb	10 <sup>12</sup> MPN						
Downtown Mall Alley	Green Street <sup>1</sup>	81%	2,600	6.9	5.1	17	15	52	0.22	0.66	0.88	2.5	2.9	0.34	3.4	8.5	7.7	0.042
Linden Ditch	Infiltration System	68%	77,000	110	87	170	440	800	2.9	9.2	11	38	45	9.4	110	270	170	1.7
Mary Lake Pond	Lake Restoration <sup>2</sup>	73%	80,000	150	110	190	440	990	2.9	7.8	4.0	14	31	25	62 <sup>3</sup>	150 <sup>3</sup>	190	4.1
Former City Sewer Ponds	Natural Treatment System	38%	280,000	900	660	1,300	2,100	5,000	29	63	120	370	380	120	260	640	920	13
Market-Pine Alley	Green Street <sup>1</sup>	64%	1,300	7.3	5.9	13	9.0	42	0.30	0.65	1.3	2.7	3.3	0.28	2.1	5.1	5.6	0.028

<sup>1</sup>The project benefits are those resulting from both the rain garden (bioretention with underdrains) and porous pavement.

<sup>2</sup>The project benefits are those resulting from the enhanced upper natural treatment system, east natural treatment system, and west natural treatment system.

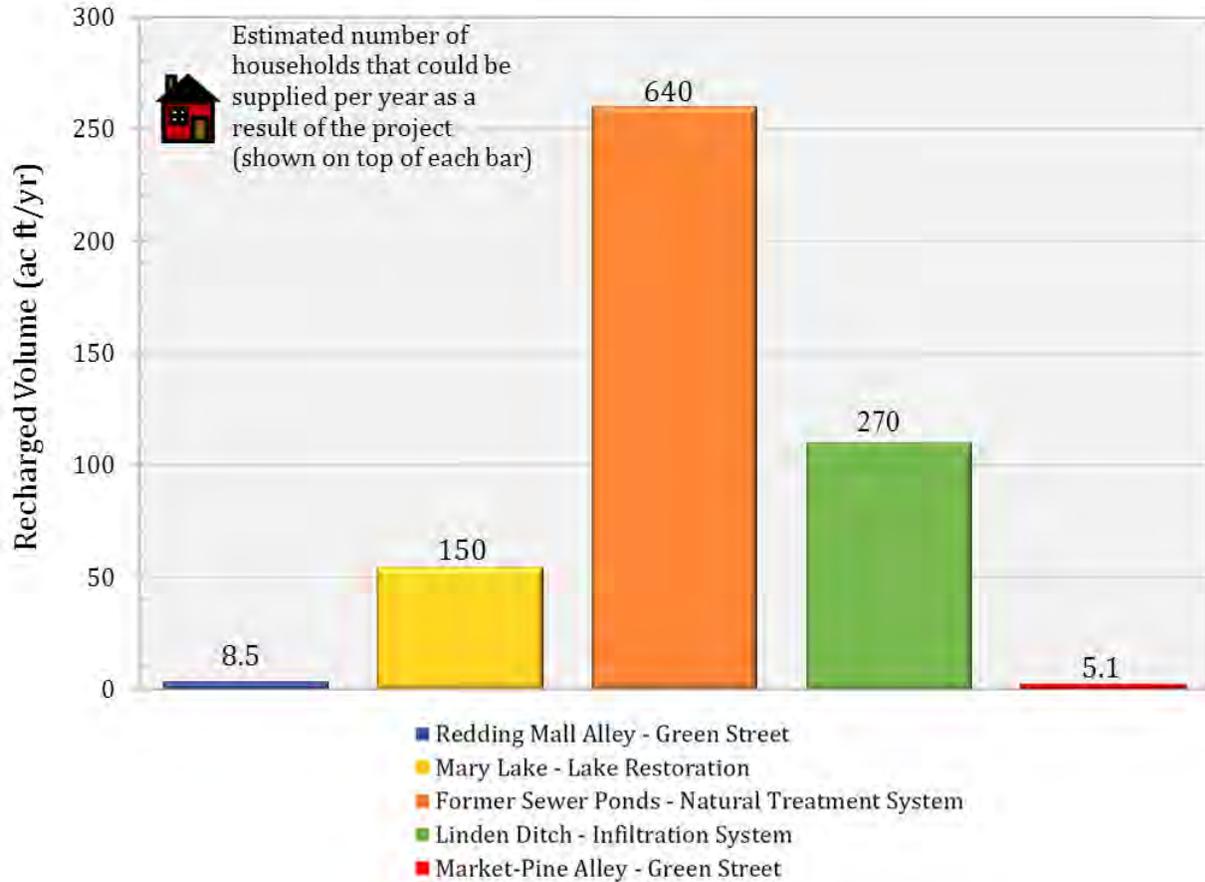

<sup>3</sup>The water supply benefit represents the both the volume of groundwater recharged (54 acre-ft) and the quantity of water provided by the storage tank (4.0 acre-ft) and enhanced upper natural treatment system (approximately 4.0 acre-ft considering evaporation) that will offset potable water to maintain lake levels during the summer.

Figure G-2 shows the average annual pollutant loads for key parameters to each conceptual project and also illustrates the portion that would be reduced (i.e., through infiltration, evapotranspiration, or treatment) as a result of implementation of the conceptual project (as shown by the black hatching).

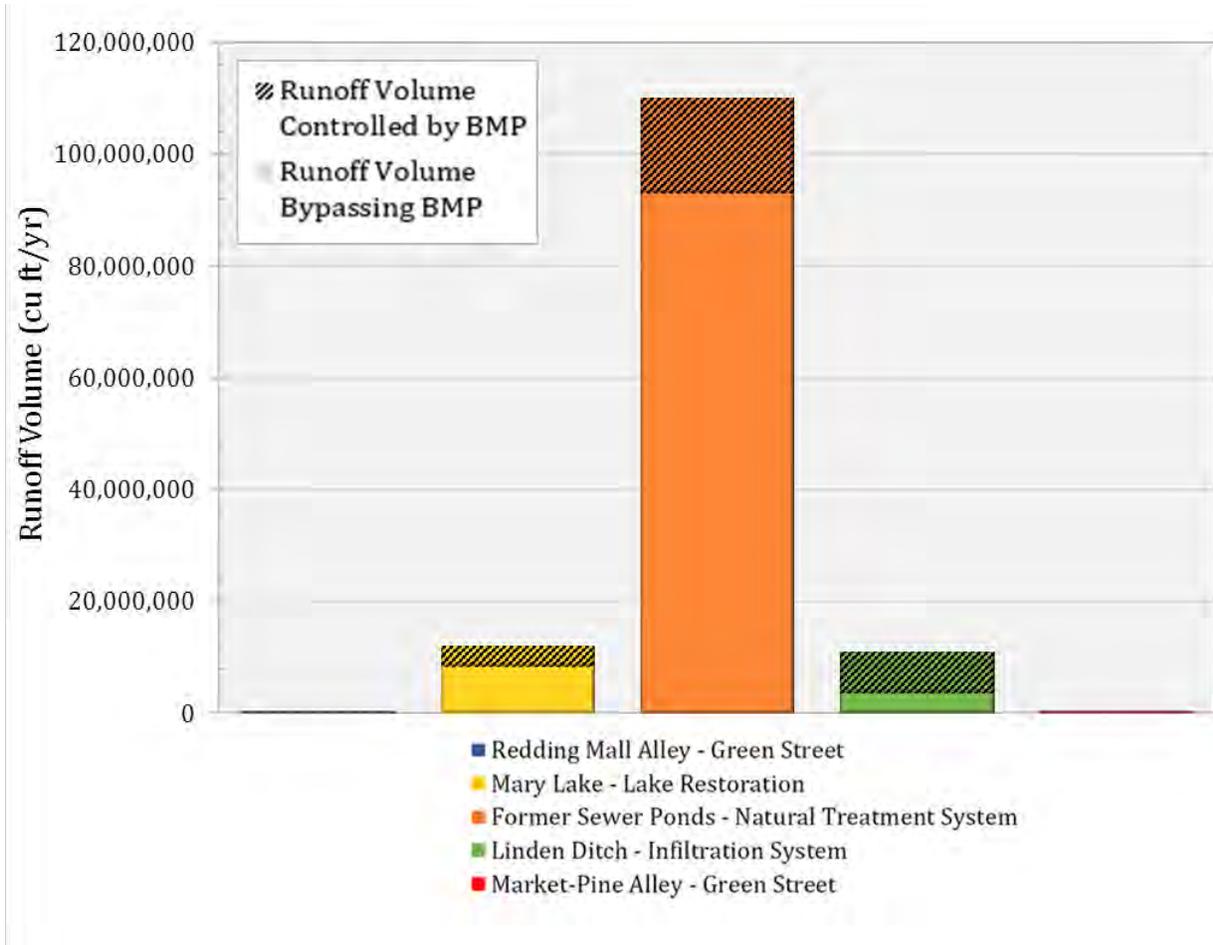

**Figure G-2. Project Water Quality Benefits – Average Annual Pollutant Load Reductions**

Figure G-3 shows the average annual groundwater recharge that is anticipated as a result of implementation of each conceptual project, which is based on the volume of runoff infiltrated by the project multiplied by an adjustment factor to compute a potential groundwater recharge volume (discussed further in Appendix F). The number of households that could be supplied with their entire yearly water demand due to the potential increase in water supply volume (household equivalents supplied) is also estimated, based on average annual household water use in California (362 gal/household/day) and the estimated groundwater recharge volumes.

**Figure G-3. Project Water Supply Benefits – Average Annual Groundwater Recharge Volume**

Figure G-4 shows the average annual runoff volume to each conceptual project and also illustrates the portion that would be controlled (i.e., through infiltration; evapotranspiration; or detention, treatment, and release) as a result of implementation of the conceptual project (as shown by the black hatching). The runoff volume not controlled by the BMP (shown without the black hatching) bypasses the conceptual project and would not be controlled through infiltration, evapotranspiration, or detention, treatment, and release.

**Figure G-4. Project Flood Management Benefits – Average Annual Runoff Volume Controlled**

## **SECTION 6. PROJECT MULTIPLE BENEFIT PRIORITIZATION**

As required by California Water Code Section 10562(e) and Section VI.D of the Guidelines, the SWRP must use measurable factors to prioritize projects. The approach for prioritizing the conceptual projects consists of two parts. Projects were first assigned multi-benefit indices based on their quantitative and qualitative potential to achieve multiple benefits in the five benefit categories identified by the Guidelines: water quality, water supply, flood control, community, and environmental. Projects were then prioritized based on their multi-benefit indices and their potential to be implemented and maintained (i.e., with a committed landowner and operation and maintenance capabilities). The methodology for scoring multiple benefits to determine multi-benefit indices and prioritizing projects is described in Appendix F.

The results for scoring multiple benefits, including determination of the multi-benefit indices and prioritization of projects, are presented in Section 6.1.1 for conceptual projects and Section 6.1.2 for non-modeled projects. Additionally, a decision support tool created for the SWRP (described in detail in Section 5.4 of the SWRP), calculates and prioritizes the project multi-benefit indices for all projects whenever a new project is added to the SWRP.

### **6.1 Project Multi-Benefit Indices and Prioritization Results**

#### **6.1.1 Conceptual Projects**

Multiple benefit indices for conceptual projects were developed using modeling results for estimated annual pollutant load reductions, runoff volume captured and potential water supply volume, in addition to other quantitative measurements like approximate BMP footprint and qualitative scores as well. The methodology for determination of the benefit scores was outlined in Section 5.1 of Appendix F (unique to conceptual projects), and the methodology for prioritization was described in Section 5.2 of Appendix F. The water quality benefits scores for each modeled pollutant (used to determine the overall water quality quantitative benefit score) are shown in Table G-6. The quantitative benefit scores and qualitative weights for each benefit category (as applicable) are shown in Table G-7 and Table G-8, respectively. The overall benefit scores for each benefit category (combining the qualitative and quantitative scores, as applicable) and the overall multi-benefit indices for each conceptual project are shown in Table G-9. For all tables presented below, shading from light blue to dark blue indicates low to high values.

**Table G-6. Individual Quantitative Water Quality Benefit Scores for Conceptual Projects**

Project Location	Project Type	Quantitative Water Quality Benefit Scores											
		TSS	TP	Diss P	NH3	NO3	TKN	Diss Cu	Tot Cu	Tot Pb	Diss Zn	Tot Zn	Fecal Coliform
Former City Sewer Ponds	Natural Treatment System	5.0	5.0	5.0	5.0	5.0	5.0	5.0	5.0	5.0	5.0	5.0	5.0
Linden Ditch	Infiltration System	4.8	3.7	4.0	4.5	5.0	4.0	5.0	5.0	5.0	5.0	5.0	1.9
Mary Lake Pond	Lake Restoration	5.0	5.0	5.0	5.0	5.0	5.0	5.0	4.2	1.8	1.8	3.4	5
Market-Pine Alley	Green Street	0.081	0.24	0.27	0.34	0.10	0.21	0.52	0.35	0.59	0.36	0.37	0.056
Downtown Mall Alley	Green Street	0.16	0.23	0.23	0.45	0.17	0.26	0.38	0.36	0.40	0.33	0.32	0.068

**Table G-7. Quantitative Benefit Scores for Conceptual Projects**

Project Location	Project Type	Quantitative Benefit Scores			
		Water Quality (weighted) <sup>1</sup>	Water Supply	Flood Management	Environmental
Former City Sewer Ponds	Natural Treatment System	5.0	5.0	5.0	5.0
Linden Ditch	Infiltration System	4.3	5.0	4.3	2.1
Mary Lake Pond	Lake Restoration	4.3	2.8	5.0	5.0
Market-Pine Alley	Green Street	0.28	0.095	0.14	0.033
Downtown Mall Alley	Green Street	0.27	0.15	0.20	0.051

<sup>1</sup> Determined based on water quality quantitative scores shown in Table G-6 and water quality priority pollutant weights shown in Table F-7 in Appendix F

**Table G-8. Qualitative Benefit Weights for Conceptual Projects**

Project Location	Project Type	Qualitative Benefit Weights			
		Water Supply	Flood Management	Environmental	Community
Former City Sewer Ponds	Natural Treatment System	3	5	5	5
Linden Ditch	Infiltration System	3	5	5	5
Mary Lake Pond	Lake Restoration	5	1	5	5
Market-Pine Alley	Green Street	3	1	5	5
Downtown Mall Alley	Green Street	3	1	5	5

**Table G-9. Overall Benefits Scores and Multi-Benefit Indices for Conceptual Projects**

Project Location	Project Type	Overall Benefit Scores					Multi-Benefit Index
		Water Quality	Water Supply	Flood Management	Environmental	Community	
Former City Sewer Ponds	Natural Treatment System	5.0	3.0	5.0	5.0	5.0	4.6
Linden Ditch	Infiltration System	4.3	3	4.3	2.1	5.0	3.7
Mary Lake Pond	Lake Restoration	4.3	2.8	1.0	5	5.0	3.6
Market-Pine Alley	Green Street	0.28	0.057	0.029	0.033	5.0	0.61
Downtown Mall Alley	Green Street	0.27	0.093	0.040	0.051	5.0	0.62

The prioritization designations for the conceptual projects are shown in Table G-10. It was assumed that public parcels (i.e., owned by the City of Redding, County of Shasta, or the State of California) have potentially willing land owners, while all other parcels (i.e., agricultural parcels) do not currently have a willing land owner. If the City coordinates with non-public land owners, the prioritization may easily be updated based on land owner willingness and the guidelines outlined herein.

**Table G-10. Prioritization for Conceptual Projects**

<b>Project Location</b>	<b>Project Type</b>	<b>Prioritization (low, medium, or high)</b>
Former City Sewer Ponds	Natural Treatment System	High
Linden Ditch	Infiltration System	High
Mary Lake Pond	Lake Restoration	High
Market-Pine Alley	Green Street	High
Downtown Mall Alley	Green Street	High

### **6.1.2 Non-Modeled Projects**

Table G-11 shows qualitative benefit scores for each non-modeled project for water quality, water supply, flood management, environmental, and community benefits. The calculated multi-benefit index and prioritization designation for each project is also shown in Table G-11. The methodology for determination of the benefit scores was outlined in Section 5.1 of Appendix F (unique to non-modeled projects), and the methodology for prioritization was described in Section 5.2 of Appendix F (identical to prioritization for conceptual projects).

**Table G-11. Multiple Benefits and Prioritization for Non-modeled projects**
